- Image formation model :

$$i = \mathcal{P}(o * h)$$

where  $\mathcal{P}$  is a Poisson noise,  $i$  the observed image,  $o$  the object and  $h$  the PSF.

- Our objective is to estimate the original image, *i.e.* obtaining  $\hat{o}$  only having an observation  $i$ .
- In order to preserve thin structures, we want to use wavelet transforms to reach this goal.
- Pre-processings (Anscombe, Fisz) used to stabilize the noise variance in order to apply common methods of image restoration.

# RICHARDSON-LUCY ALGORITHM

- Overview
- Introduction

## Background

- Richardson-Lucy
- Pre-processings
- Denoising + Deconvolution
- Deconvolution + denoising

## Wavelet Transforms

## Deconvolution algorithms

## Simulation results

## Perspectives

Under Poisson process assumption :

$$p(i | o) = \prod_{\mathbf{x}} \left( \frac{(h * o)(\mathbf{x})^{i(\mathbf{x})} e^{-(h * o)(\mathbf{x})}}{i(\mathbf{x})!} \right)$$

➤ Maximum likelihood estimation :

$$\text{Minimize } J_1(o) = \sum_{\mathbf{x}} \left( -i(\mathbf{x}) \log [(h * o)(\mathbf{x})] + (h * o)(\mathbf{x}) \right) + c^{st}$$

Iterative algorithm :

$$o_{n+1}(\mathbf{x}) = \left\{ \left[ \frac{i(\mathbf{x})}{o_n(\mathbf{x}) * h(\mathbf{x})} \right] * h(-\mathbf{x}) \right\} \cdot o_n(\mathbf{x})$$

➤ Regularisation by Total Variation [Dey *et al.*, 2004] :

$$J_1(o) + J_{reg}(o) = J_1(o) + \lambda \sum_{\mathbf{x}} |\nabla o(\mathbf{x})|$$

Associated iterative algorithm :

$$o_{n+1}(x) = \left\{ \left[ \frac{i(x)}{o_n(x) * h(x)} \right] * h(-x) \right\} \frac{o_n(x)}{1 - \lambda \text{div} \left( \frac{\nabla o_n(x)}{|\Delta o_n(x)|} \right)}$$

# PRE-PROCESSINGS

- Overview
- Introduction

## Background

- Richardson-Lucy
- **Pre-processings**
- Denoising + Deconvolution
- Deconvolution + denoising

## Wavelet Transforms

## Deconvolution algorithms

## Simulation results

## Perspectives

### ■ Anscombe transform :

$$\mathcal{A}(i(x, y, z)) = 2 \sqrt{i(x, y, z) + \frac{3}{8}}.$$

### ■ Fisz transform :

1. Process a non normalized Haar transform
2. Transform the detail coefficients  $d_{j,\mathbf{m}}(\mathbf{k})$  of level  $j$ , subband  $\mathbf{m}$  and spatial position  $\mathbf{k}$  as

$$d_{j,\mathbf{m}}(\mathbf{k}) = \begin{cases} d_{j,\mathbf{m}}(\mathbf{k}) / \sqrt{a_{j,\mathbf{m}}(\mathbf{k})} & \text{if } a_{j,\mathbf{m}}(\mathbf{k}) \neq 0 \\ 0 & \text{if } a_{j,\mathbf{m}}(\mathbf{k}) = 0 \end{cases}$$

where  $a_{j,\mathbf{m}}$  denotes the approximation coefficients.

3. Reconstruct using the inverse non normalized Haar transform.

→ After such processings, the noise can be asymptotically considered as  $\mathcal{N}(\mu, 1)$ .

# DENOISING + DECONVOLUTION ALGORITHM

- Overview
- Introduction

## Background

- Richardson-Lucy
- Pre-processings
- **Denoising + Deconvolution**
- Deconvolution + denoising

## Wavelet Transforms

## Deconvolution algorithms

## Simulation results

## Perspectives

➤ **Step 1** : Denoising by coefficient thresholding using Steerable pyramids [Rooms *et al.*, 2005] or using wavelets [Boutet de Monvel *et al.*, 2001], [Colicchio *et al.*, 2007]

➤ **Step 2** : Deconvolution using the RL algorithm or a MAP

➤ Pre-processing stage to stabilize the noise variance

➤ **DIFFICULTIES :**

- Is the PSF modified during **Step 1** ? (In [Rooms *et al.*, 2005] they estimate it after denoising)
- What is the nature of the residual noise after **Step 1** ?

# DECONVOLUTION + DENOISING

- Overview
- Introduction

## Background

- Richardson-Lucy
- Pre-processings
- Denoising + Deconvolution
- **Denoising + Deconvolution**

## Wavelet Transforms

## Deconvolution algorithms

## Simulation results

## Perspectives

➤ **Step 1** : Inversion of the PSF [McNally *et al.*, 1999] taking into account it has zeros

➤ **Step 2** : Denoising by coefficient thresholding using wavelet transforms

➤ Noise estimation stage : variance estimation ...

➤ **DIFFICULTIES** :

- The noise is amplified during **Step 1**
- What is the noise nature after **Step 1** ?

---

- Background

---

- Wavelet Transforms

---

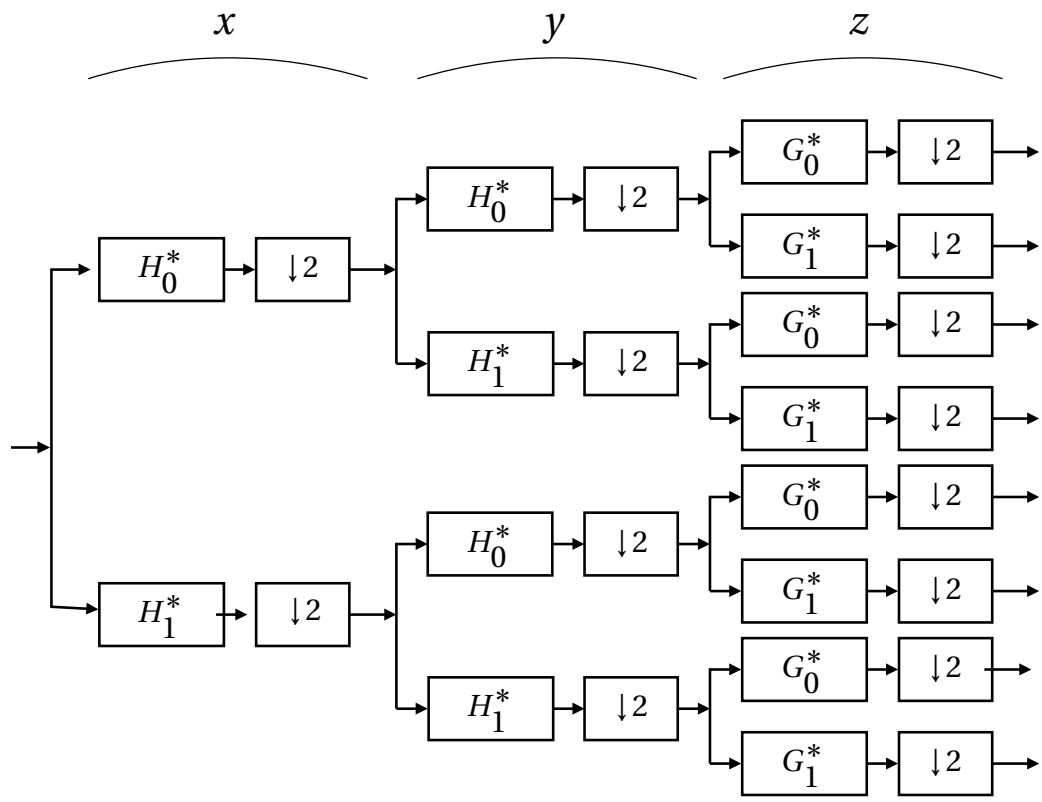

- Deconvolution algorithms
  - **First approach**
  - Second approach
  - Proposed algorithm

---

- Simulation results

---

- Perspectives

➤ Considering deconvolution then denoising

- **Step 1** : Deconvolution by PSF inversion
- **Step 2** : Denoising using 3D DWT (thresholding).

➤ Considering denoising then deconvolution

- **Step 1** : Denoising by coefficient thresholding using 3D DWT
- **Step 2** : Deconvolution using the RL algorithm or a standard algorithm if the noise is no longer Poisson.

## SECOND APPROACH

- Overview
- Introduction

Background

---

Wavelet Transforms

---

Deconvolution algorithms

- First approach
- **Second approach**
- Proposed algorithm

Simulation results

---

Perspectives

---

➤ Consider a combined approach operating in the transform domain

- Using an algorithm as in [Daubechies *et al.*, 2004] or [Combettes *et al.*, 2005]
- First considering wavelet bases (3D DWT)
- Then extending this approach to wavelet frames (redundant decomposition like the 3D CWT transform) which implies more complicated algorithms (future work).

# PROPOSED ALGORITHM

- Overview
- Introduction

Background

---

Wavelet Transforms

---

Deconvolution algorithms

- First approach
- Second approach
- **Proposed algorithm**

Simulation results

---

Perspectives

---

Considering an additive noise  $n$  leading to the observation  
 $i = h * o + n$ .

**Objective :**

$$\underset{o \in H}{\text{minimize}} \quad \frac{1}{2} \|h * o - i\|^2 + \sum_{k \in K} \phi_k(\langle o | e_k \rangle).$$

**Algorithm :**

$$o_{n+1} = o_n + \lambda_n (\text{prox}_{\gamma_n \phi_k} \langle o_n + \gamma_n (h^*(i - h * o_n)) | e_k \rangle - o_n)$$

- $e_k$  stands for an orthonormal basis.
- We can choose

$$\phi = \omega | \cdot |$$

$$\phi = \omega | \cdot |^2$$

- $\omega$  is a a fixed parameter and  $\phi$  a fixed regularization function.
- $\gamma$  : step size and  $\lambda = 1$  : relaxation parameter.

## FUTURE WORKS

- Overview
- Introduction

Background

Wavelet Transforms

Deconvolution algorithms

Simulation results

Perspectives

● Future works

- Considering an  $M$ -band wavelet transform instead of a dyadic wavelet transform
- Using the dual-tree wavelet transform which is directional and which has a limited redundancy
- Directly considering Poisson noise instead of pre-processing data
- Consider a mixture of Poisson and Gaussian noise (MPG) [Zhang *et al.*, 2007]
- Using a "local" method partitioning the image into smaller areas in order to make assumptions on "local" noise properties
- ...
