#### Discrete Morse Theory

## Growing balls

Take a point set  $\{P_1, \dots, P_N\} \subset \mathbb{R}^n$ . We assume general position. Assign a weight  $w_i$  to each point  $P_i$ .

## Growing balls

Take a point set  $\{P_1, \dots, P_N\} \subset \mathbb{R}^n$ . We assume general position. Assign a weight  $w_i$  to each point  $P_i$ .

We show here a picture and next link to cabri

We are interested in the change of topology and geometry of the growing balls by increasing radius.

  $g(x) = \min_{1 \le i \le N} g_i(x)$  (2)

 $g_i$  is the Power distance function

Definition Let  $\alpha \subset \{P_1, \cdots, P_N\}$ :

 $\mathsf{Pow}(\alpha) = \mathsf{cl}\{x \in \mathbb{R}^n \mid g_i(x) = g(x) \ P_i \in \alpha \text{ and } g_j(x) > g(x) \ P_j \notin \alpha\}$ 

A D F A 同 F A E F A E F A Q A

The sets  $Pow(\alpha)$  are called (power) cells. The codimension 1 skeleton is called the Power or Voronoi Diagram.

## Voronoi-Power diagrams

Take a point set  $\{P_1, \dots, P_N\} \subset \mathbb{R}^n$ . Assign a weight  $w_i$  to each point  $P_i$ . Let  $||x||^2 = \sum_{i=1}^n x_i^2$ . Consider  $g_i \colon \mathbb{R}^n \to \mathbb{R}$ 

$$g_i(x) = \frac{1}{2} \|x - P_i\|^2 - \frac{1}{2} w_i$$
  $g(x) = \min_{1 \le i \le N} g_i(x)$  (2)

 $g_i$  is the Power distance function

Definition Let  $\alpha \subset \{P_1, \cdots, P_N\}$ :

 $\mathsf{Pow}(\alpha) = \mathsf{cl}\{x \in \mathbb{R}^n \mid g_i(x) = g(x) \ P_i \in \alpha \text{ and } g_j(x) > g(x) \ P_j \notin \alpha\}$ 

The sets  $Pow(\alpha)$  are called (power) cells. The codimension 1 skeleton is called the Power or Voronoi Diagram.

It is no restriction to assume that  $w_i > 0$ . We may add some number to all of the functions  $g_i$ : the cells will not change.

## The Delaunay triangulation 💿

Construct a dual tesselation.

• Vertices are the points  $\{P_1, \cdots, P_N\}$ ,

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ の < @

## The Delaunay triangulation 💿

Construct a dual tesselation.

- Vertices are the points  $\{P_1, \cdots, P_N\}$ ,
- ► 1-cells (edges) P<sub>i</sub>P<sub>j</sub> as soon as Pow(P<sub>i</sub>) and Pow(P<sub>j</sub>) share a common face,

(ロ) (同) (三) (三) (三) (○) (○)

## The Delaunay triangulation ••

Construct a dual tesselation.

- Vertices are the points  $\{P_1, \cdots, P_N\}$ ,
- ► 1-cells (edges) P<sub>i</sub>P<sub>j</sub> as soon as Pow(P<sub>i</sub>) and Pow(P<sub>j</sub>) share a common face,
- k-cells α as soon as Pow(α) is non-void. The geometric realization of cells are Del(α), the convex hull of the point set α ⊂ ℝ<sup>n</sup>.

(ロ) (同) (三) (三) (三) (○) (○)

## The Delaunay triangulation ••

Construct a dual tesselation.

- Vertices are the points  $\{P_1, \cdots, P_N\}$ ,
- ► 1-cells (edges) P<sub>i</sub>P<sub>j</sub> as soon as Pow(P<sub>i</sub>) and Pow(P<sub>j</sub>) share a common face,
- k-cells α as soon as Pow(α) is non-void. The geometric realization of cells are Del(α), the convex hull of the point set α ⊂ ℝ<sup>n</sup>.

Note that  $Pow(\alpha)$  and  $Del(\alpha)$  lie in orthogonal hyperplanes of complementary dimension. The unique intersection point of these hyperplanes  $c(\alpha)$  is the center of the circumscribed sphere of  $\alpha$  in the spanning affine space

### Critical points of the distance function

Let *x* be on the power diagram; then there is a set  $\alpha$  (nearest neighbours) such that

$$g(x) = g_i(x) \Leftrightarrow P_i \in lpha$$
; so  $x \in \mathsf{Pow}(lpha)$ 

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

#### Critical points of the distance function

Let *x* be on the power diagram; then there is a set  $\alpha$  (nearest neighbours) such that

$$g(x) = g_i(x) \Leftrightarrow P_i \in \alpha$$
; so  $x \in \mathsf{Pow}(\alpha)$ 

Now grad  $g_i(x) = x - P_i = \overrightarrow{xP_i}$  since  $g_i(x) = \frac{1}{2} ||x - P_i||^2 - \frac{1}{2} w_i$ Generalized derivative  $\partial g(x) = CH(\overrightarrow{xP_i}|P_i \in \alpha) = Del(\alpha)$ .

(日) (日) (日) (日) (日) (日) (日)

### Critical points of the distance function

Let *x* be on the power diagram; then there is a set  $\alpha$  (nearest neighbours) such that

$$g(x) = g_i(x) \Leftrightarrow P_i \in \alpha$$
; so  $x \in \mathsf{Pow}(\alpha)$ 

Now grad  $g_i(x) = x - P_i = \overrightarrow{xP_i}$  since  $g_i(x) = \frac{1}{2} ||x - P_i||^2 - \frac{1}{2} w_i$ Generalized derivative  $\partial g(x) = CH(\overrightarrow{xP_i}|P_i \in \alpha) = Del(\alpha)$ .

From non-smooth critical point theory :

x critical iff  $O \in \partial g(x)$ 

x critical iff  $O \in \partial g(x)$ 

 $x \in \mathsf{Del}(\alpha)$  critical $x \notin \mathsf{Del}(\alpha)$  non critical $x = \mathsf{Pow}(\alpha) \cap \mathsf{Del}(\alpha)$ 

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

The index of the critical point *x* is equal to  $k = \dim \langle \text{Del}(\alpha) \rangle$ .

## Morse Formula

The following Morse formula is a non differentiable version of the 'mountaineering equation'.

Theorem

Let  $s_i$  be the number of critical points of index i of g. We have:

$$\sum (-1)^i s_i = 1$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

In 2-dimensional case m - s + M = 1

## Morse Formula

The following Morse formula is a non differentiable version of the 'mountaineering equation'.

#### Theorem

Let  $s_i$  be the number of critical points of index i of g. We have:

$$\sum (-1)^i s_i = 1$$

In 2-dimensional case m - s + M = 1

#### Proof.

*g* is a topological Morse function. In that case, as *t* grows, *g* passes through a number of non-degenerate critical values. When *g* passes a critical value of index *i*, an *i*-cell gets attached. In between we apply the (topological) regular interval theorem. For each intermediate function value *t* we have therefore :

$$\chi(\{g(x) \le t\}) = \sum (-1)^i s_i(t)$$

## The Morse poset

Critical points determine an active cell in the Delaunay tesselation. The set of active cells form the Morse poset: a combinatorial description of critical points.

#### Digression on tropical geometry

We will connect the theory of power diagrams with the concept of tropical hypersurface in tropical geometry.

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Tropical geometry is relatively new: it connects algebraic geometry problems with combinatorial questions on certain polytopes.

#### Digression on tropical geometry

We will connect the theory of power diagrams with the concept of tropical hypersurface in tropical geometry.

Tropical geometry is relatively new: it connects algebraic geometry problems with combinatorial questions on certain polytopes.

Recall that algebraic geometry studies varieties: the zero set of polynomials with real or complex coefficients in affine space.

## Min-plus algebra

In tropical geometry one considers two new operations in  $\mathbb{R}$ :

(ロ) (同) (三) (三) (三) (○) (○)

- tropical addition:  $x \oplus y := \min(x, y)$ , and
- tropical multiplication:  $x \otimes y := x + y$ .

## Min-plus algebra

In tropical geometry one considers two new operations in  $\mathbb{R}$ :

- tropical addition:  $x \oplus y := \min(x, y)$ , and
- tropical multiplication:  $x \otimes y := x + y$ .

With these two operations  $\mathbb{R}$  gets the structure of a topological semi-ring. Such a tropical semi-ring is called a min-plus algebra.

Polynomials in tropical geometry are defined in the usual way.

(日) (日) (日) (日) (日) (日) (日)

## Min-plus algebra

In tropical geometry one considers two new operations in  $\mathbb{R}$ :

- tropical addition:  $x \oplus y := \min(x, y)$ , and
- tropical multiplication:  $x \otimes y := x + y$ .

With these two operations  $\mathbb{R}$  gets the structure of a topological semi-ring. Such a tropical semi-ring is called a min-plus algebra.

Polynomials in tropical geometry are defined in the usual way. The "dictionary" from algebraic geometry to tropical geometry works as follows: The ordinary polynomial

$$x^3 + y^3 + 3xy + 3$$

has a tropical version:

$$\min\{3x, 3y, x + y + 3, 3\}$$

(日) (日) (日) (日) (日) (日) (日)

## Tropical hypersurfaces

Tropical polynomials are piecewise linear concave functions on  $\mathbb{R}^n$  with integer coefficients. The vertex set is defined by the exponents; in the example (3, 0), (0, 3), (1, 1), (0, 0).

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

## Tropical hypersurfaces

Tropical polynomials are piecewise linear concave functions on  $\mathbb{R}^n$  with integer coefficients. The vertex set is defined by the exponents; in the example (3,0), (0,3), (1,1), (0,0).

The analogue of a variety in tropical geometry is the non-differentiability locus of the tropical polynomial, also called the corner locus of the concave function. The pictures look similar to power diagrams. Also tesselations of the polytope of the vertex set appear in a natural way in tropical geometry.

(ロ) (同) (三) (三) (三) (○) (○)

The analogue of a variety in tropical geometry is the non-differentiability locus of the tropical polynomial, also called the corner locus of the concave function.

The pictures look similar to power diagrams. 💌

Also tesselations of the polytope of the vertex set appear in a natural way in tropical geometry.

Because of the relation  $\max(x, y) = -\min(-x, -y)$  one could also have used the operation  $x \oplus y = \max(x, y)$  to define a tropical semi-ring. Tropical hypersurfaces are defined by piecewise linear convex functions.

## Amoeba

Tropical hypersurfaces appear also as follows: Let  $V \subset (\mathbb{C}^*)^n$  be an algebraic variety. Recall that  $\mathbb{C}^* = \mathbb{C} - 0$  is the group of complex numbers under multiplication. Let Log:  $(\mathbb{C}^*)^n \to \mathbb{R}^n$  be the "logarithmic moment-map" defined by

 $Log(z_1,...,z_n) = (\log |z_1|,\cdots,\log |z_n|).$ 

(ロ) (同) (三) (三) (三) (○) (○)

## Amoeba

$$Log(z_1,...,z_n) = (\log |z_1|,\cdots,\log |z_n|).$$

Gelfand-Kapranov-Zelevinski defined the amoeba of an algebraic variety V as the image  $A = \text{Log}(V) \in \mathbb{R}^n$ . Tropical hypersurfaces are "spines" of amoebas of algebraic varieties. Mikhalkin showed that the spine is a certain limit of the amoeba and carries all topological information of the amoeba.

#### Definition

A function  $h: \mathcal{T} \to \mathbb{R}$  is called a Forman discrete Morse function if for all  $\beta \in \mathcal{T}$ 

$$\#\{\alpha \in \mathcal{T} \mid 1 + \dim(\alpha) = \dim(\beta) \ \alpha \subset \beta \ h(\alpha) \ge h(\beta)\} \le 1$$

 $\#\{\alpha \in \mathcal{T} \mid \dim(\alpha) = 1 + \dim(\beta) \ \beta \subset \alpha \ h(\alpha) \le h(\beta)\} \le 1$ 

Increasing value for increasing dimension, with maximal one exception.

In case both numbers are zero for some  $\beta \in T$ ,  $\beta$  is called critical.

Non-critical occur in pairs ; criticals are single.

Define  $h(\alpha) = g(c(\alpha))$ , the critical value on the simplex  $\alpha$ . Question: Is there a discrete Morse function extending *h* to the Delaunay tesselation ?

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

Define  $h(\alpha) = g(c(\alpha))$ , the critical value on the simplex  $\alpha$ . Question: Is there a discrete Morse function extending *h* to the Delaunay tesselation ? A candidate is  $\hat{h}(\alpha) = sup_{x \in CH(\alpha)}g(x)$ .

(ロ) (同) (三) (三) (三) (○) (○)

Define  $h(\alpha) = g(c(\alpha))$ , the critical value on the simplex  $\alpha$ . Question: Is there a discrete Morse function extending *h* to the Delaunay tesselation ?

A candidate is  $\hat{h}(\alpha) = sup_{x \in CH(\alpha)}g(x)$ . This works well in the 2-dimensional examples.

・ロト・日本・日本・日本・日本

But not in higher dimensional cases.

There is a polyhedral collapse involving 4 simplices. 💿

Define  $h(\alpha) = g(c(\alpha))$ , the critical value on the simplex  $\alpha$ . Question: Is there a discrete Morse function extending *h* to the Delaunay tesselation ?

A candidate is  $\hat{h}(\alpha) = sup_{x \in CH(\alpha)}g(x)$ . This works well in the 2-dimensional examples.

But not in higher dimensional cases.

There is a polyhedral collapse involving 4 simplices. 💽

#### Theorem

- h extends h as a (generalized) discrete Morse function, with polyheral collapses,
- $\hat{h}$  can be perturbed to a usual discrete Morse function
