Contents

1 Basic theory .................................................. 2
   1.1 Discrete-time Markov chains ................................. 2
       1.1.1 Definitions ........................................... 2
       1.1.2 Finite-state Markov chains ............................ 3
       1.1.3 Asymptotic behavior and the classification of states .... 5
       1.1.4 Markov chains with infinite state spaces ............... 8
       1.1.5 An example ............................................ 9
   1.2 Continuous-time Markov chains .............................. 9
       1.2.1 Definitions ............................................ 10
       1.2.2 Transient probabilities and the Chapman-Kolmogorov equations .... 12
       1.2.3 Asymptotic behavior .................................. 13
       1.2.4 Uniformization and other embeddings .................... 14
       1.2.5 An example ............................................ 17

2 Computing Distributions ....................................... 19
   2.1 Exact computations ...................................... 19
       2.1.1 Stationary distributions .............................. 19
       2.1.2 Transient probabilities ............................... 27
   2.2 Numerical computations ................................... 36
       2.2.1 General numerical methods for stationary probabilities ... 37
       2.2.2 General methods for transient probabilities ............ 41

3 Simulation ................................................... 47
   3.1 Simulation of Discrete-Time Markov Chains .................. 47
   3.2 Simulation of Continuous-Time Markov Chains ............... 48
       3.2.1 Trajectories and the construction of generators ........ 49
       3.2.2 Simulation Algorithms ................................ 51
   3.3 Structure-based simulation .................................. 53
       3.3.1 A dynamic Ising model ................................ 53
   3.4 Sampling from stationary distributions ....................... 57
       3.4.1 Forward simulation .................................... 57
       3.4.2 Backward simulation ................................... 58
       3.4.3 The Hastings-Metropolis Algorithm .................... 63
       3.4.4 Uniform sampling .................................... 66
