Generative Adversarial Networks (GANs)

M2 Data Science and AI

Yaohui WANG

About Me

2017.12 ~ Now, Ph.D Candidate in STARS team, Inria, France
Research Interest: GANs, Neural Network architecture, video understanding

1. GAN for video generation

2. Neural Architecture Search (NAS)

3. Activity Recognition

Outline

- Introduction
- Conditional GAN
- Lab (DCGAN for manga face generation)

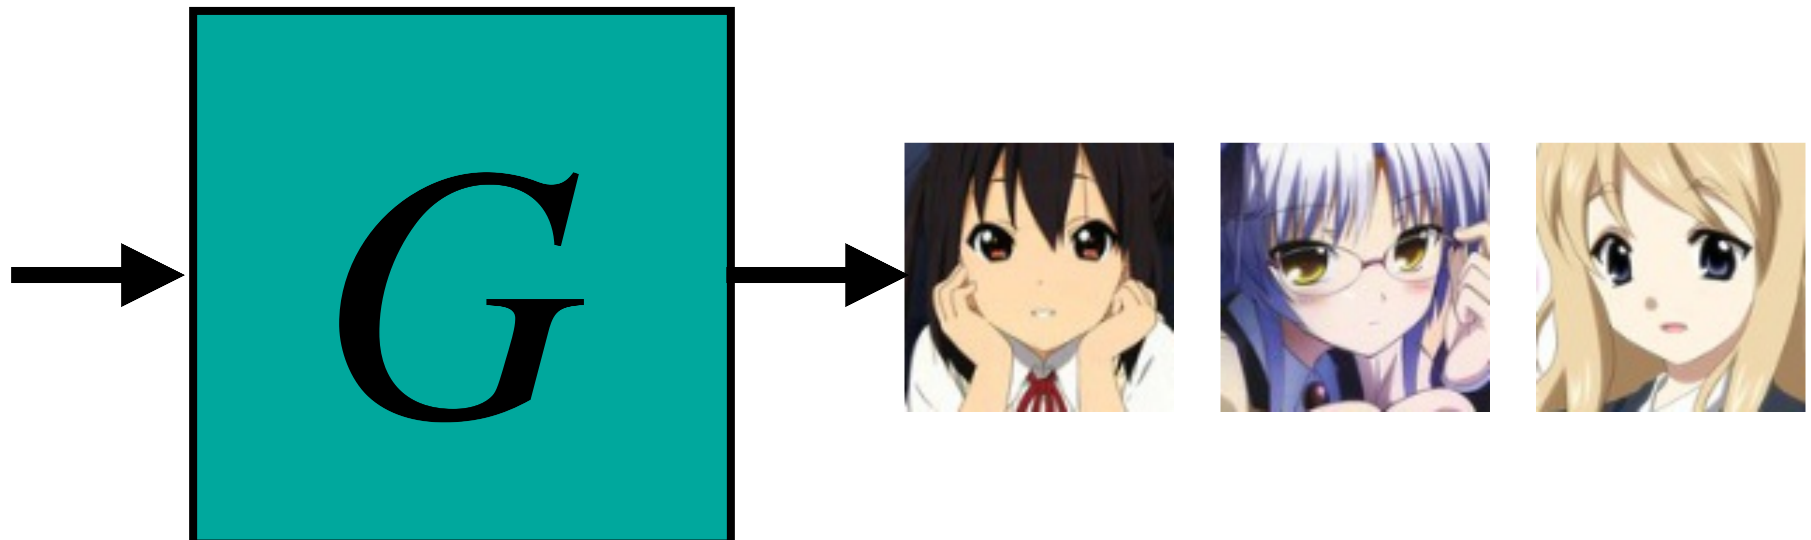
Ian Goodfellow

Generative Adversarial Networks [NIPS 2014]

"GANs are the most interesting idea in the last 10 years in ML"
- Yann LeCun

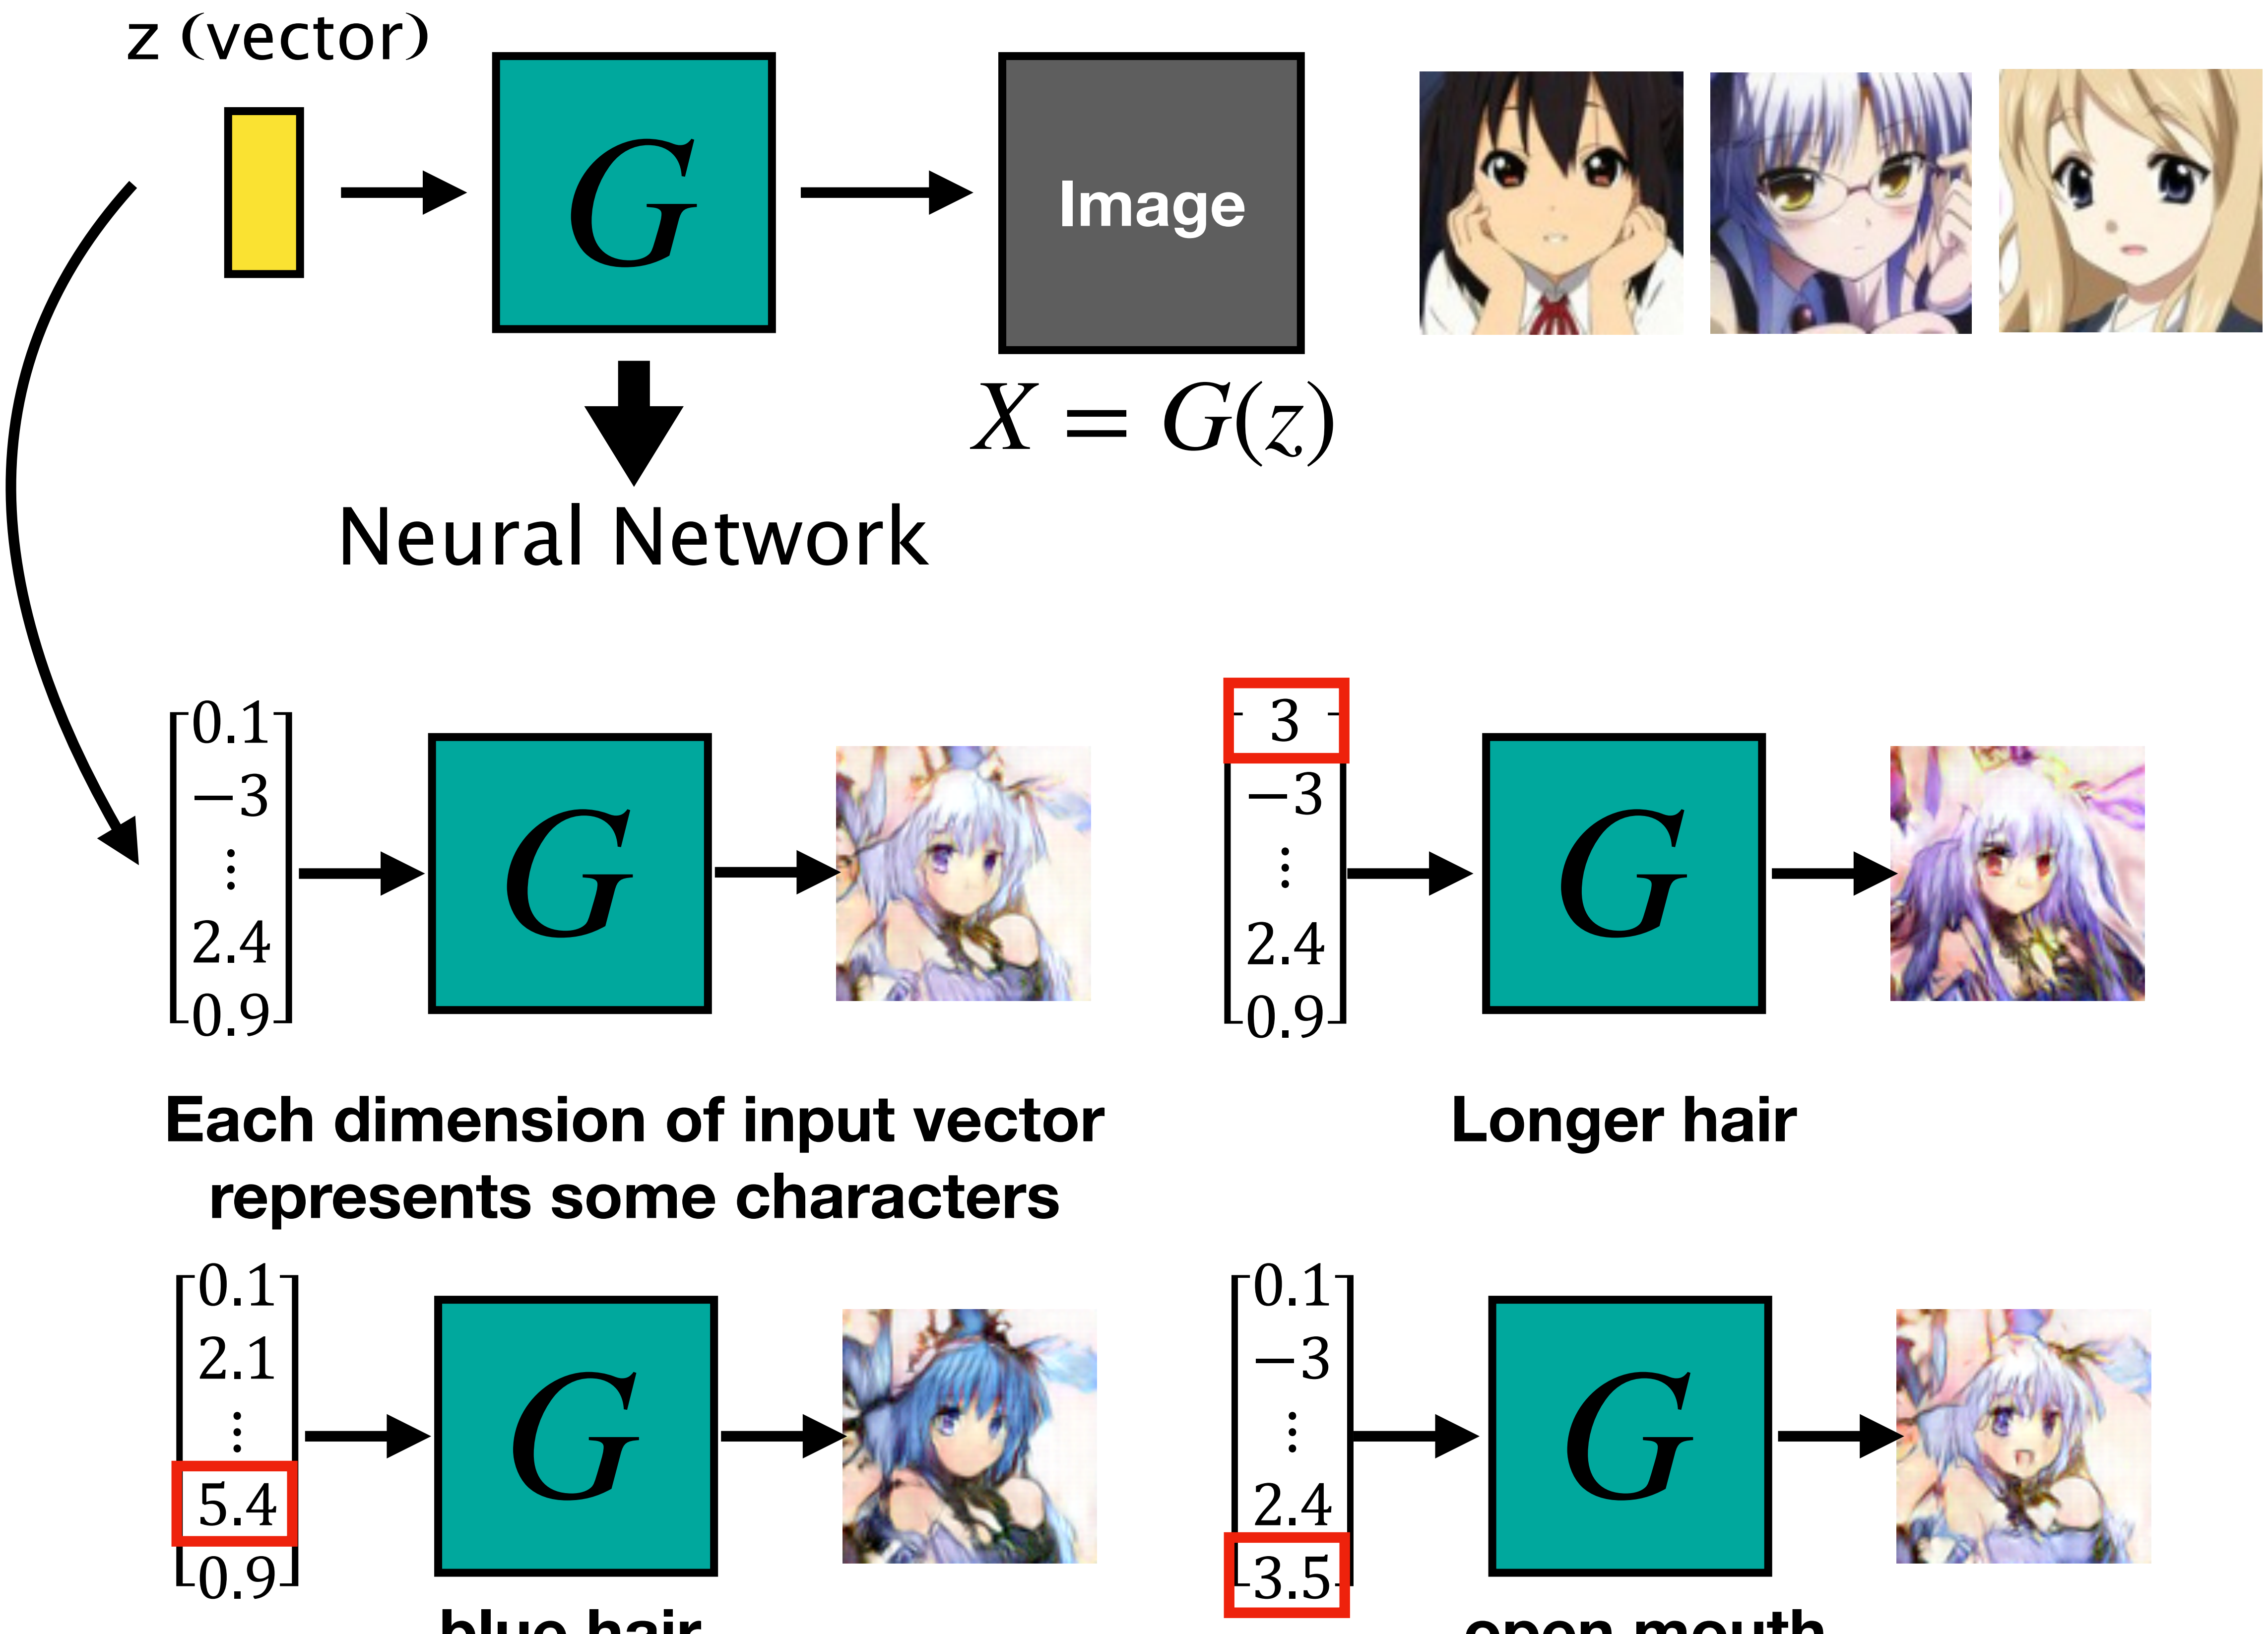
Basic idea of GAN

$$\begin{bmatrix} 0.3 \\ -0.1 \\ \vdots \\ -0.7 \end{bmatrix} \begin{bmatrix} 0.1 \\ -0.1 \\ \vdots \\ 0.7 \end{bmatrix} \begin{bmatrix} -0.3 \\ 0.1 \\ \vdots \\ 0.9 \end{bmatrix}$$

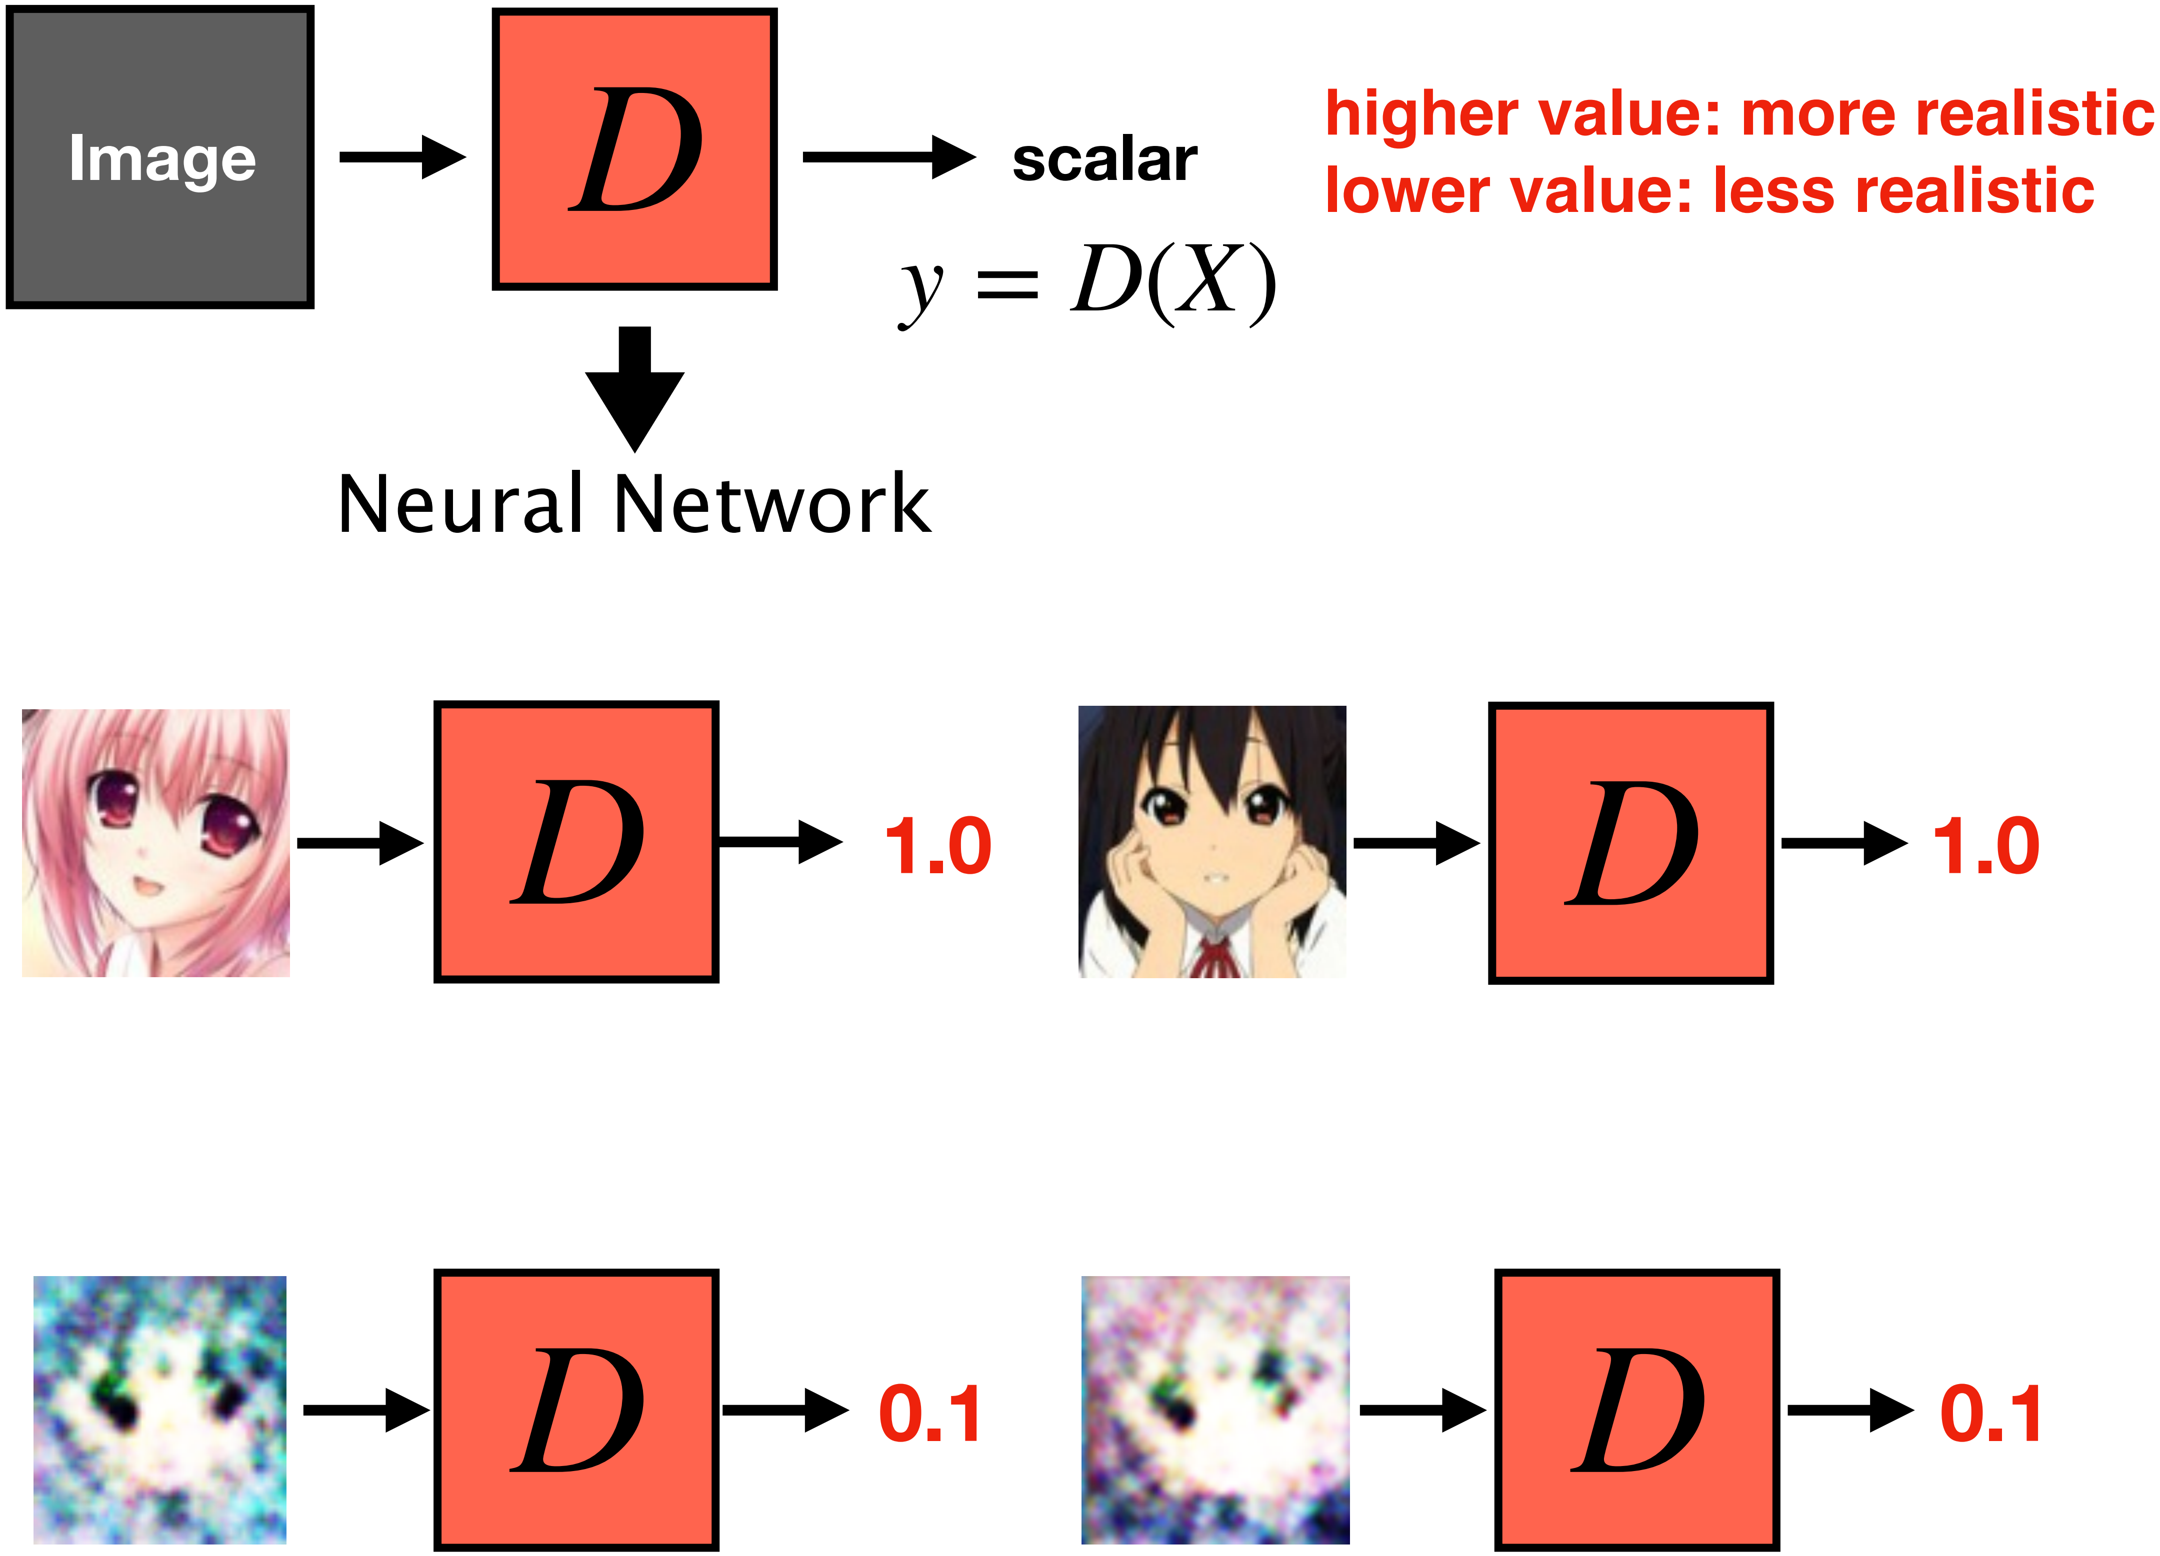


in a specific range (Gaussian, …)

Basic idea of GAN

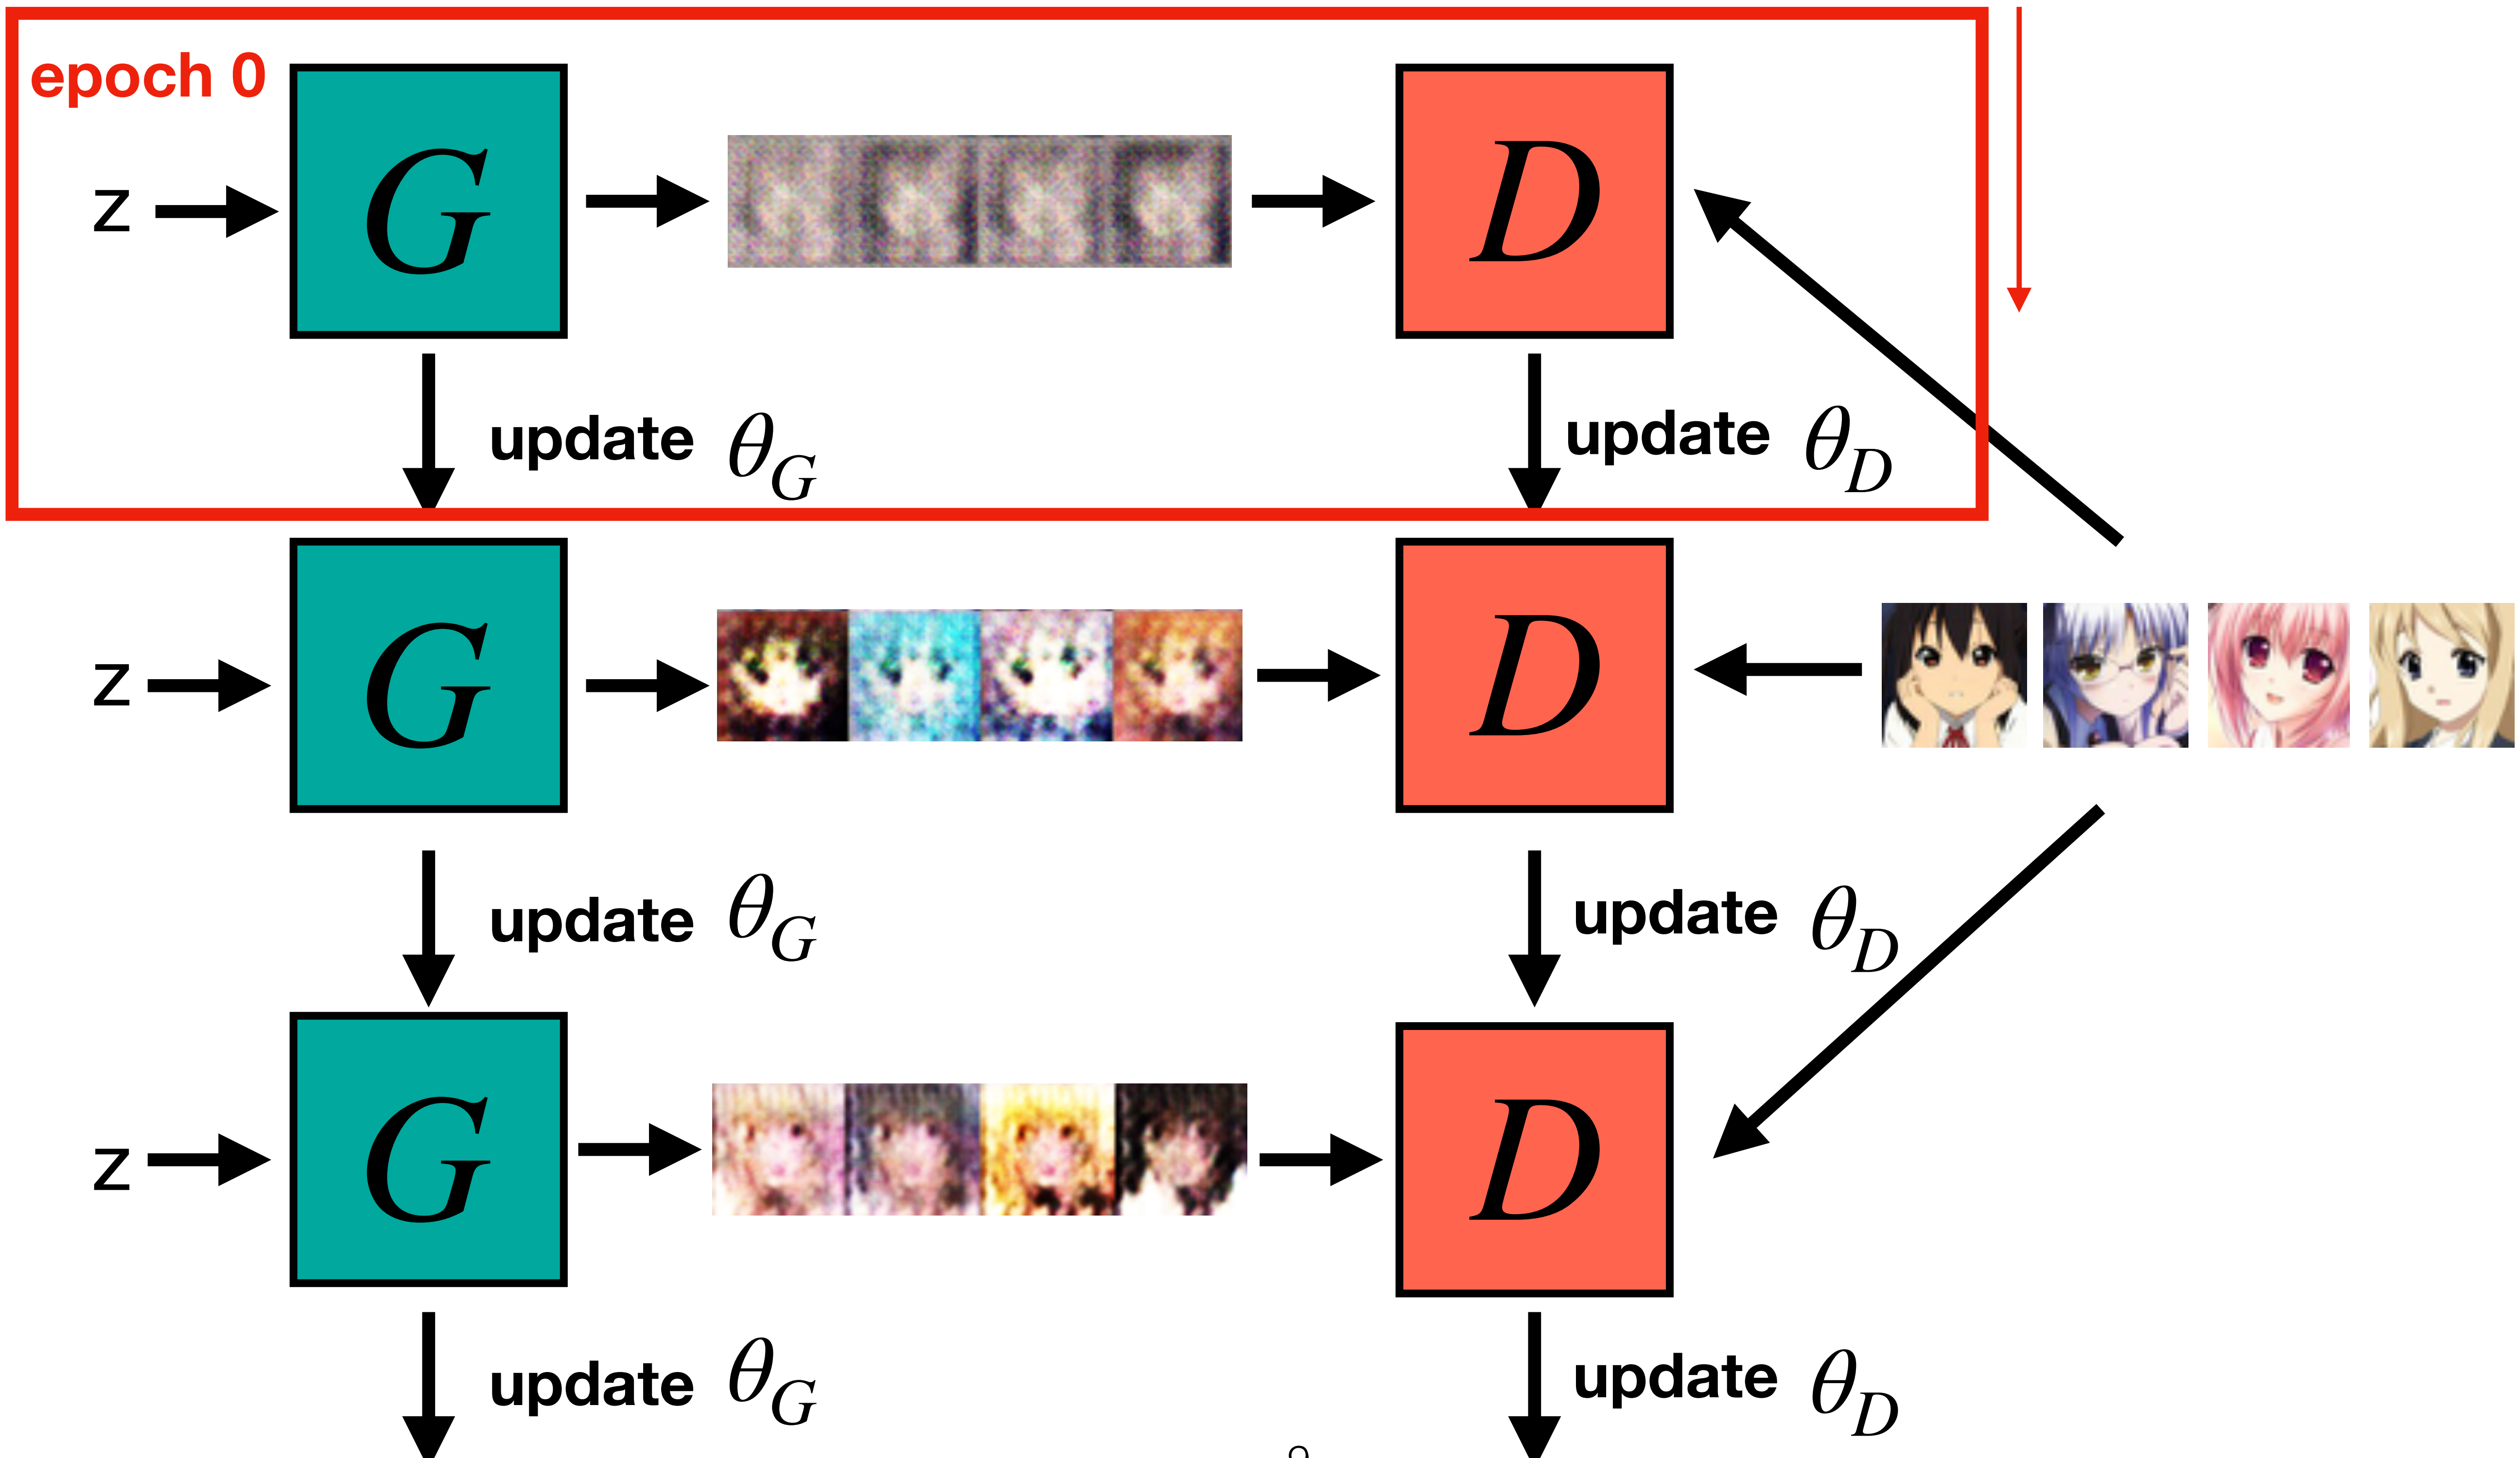


Basic idea of GAN



Basic idea of GAN

Adversarial Training (Generative Adversarial Networks)



Basic idea of GAN

Adversarial Training (Generative Adversarial Networks)

Algorithm Initialize θ_d for D and θ_g for G

- In each training iteration:

Learning D

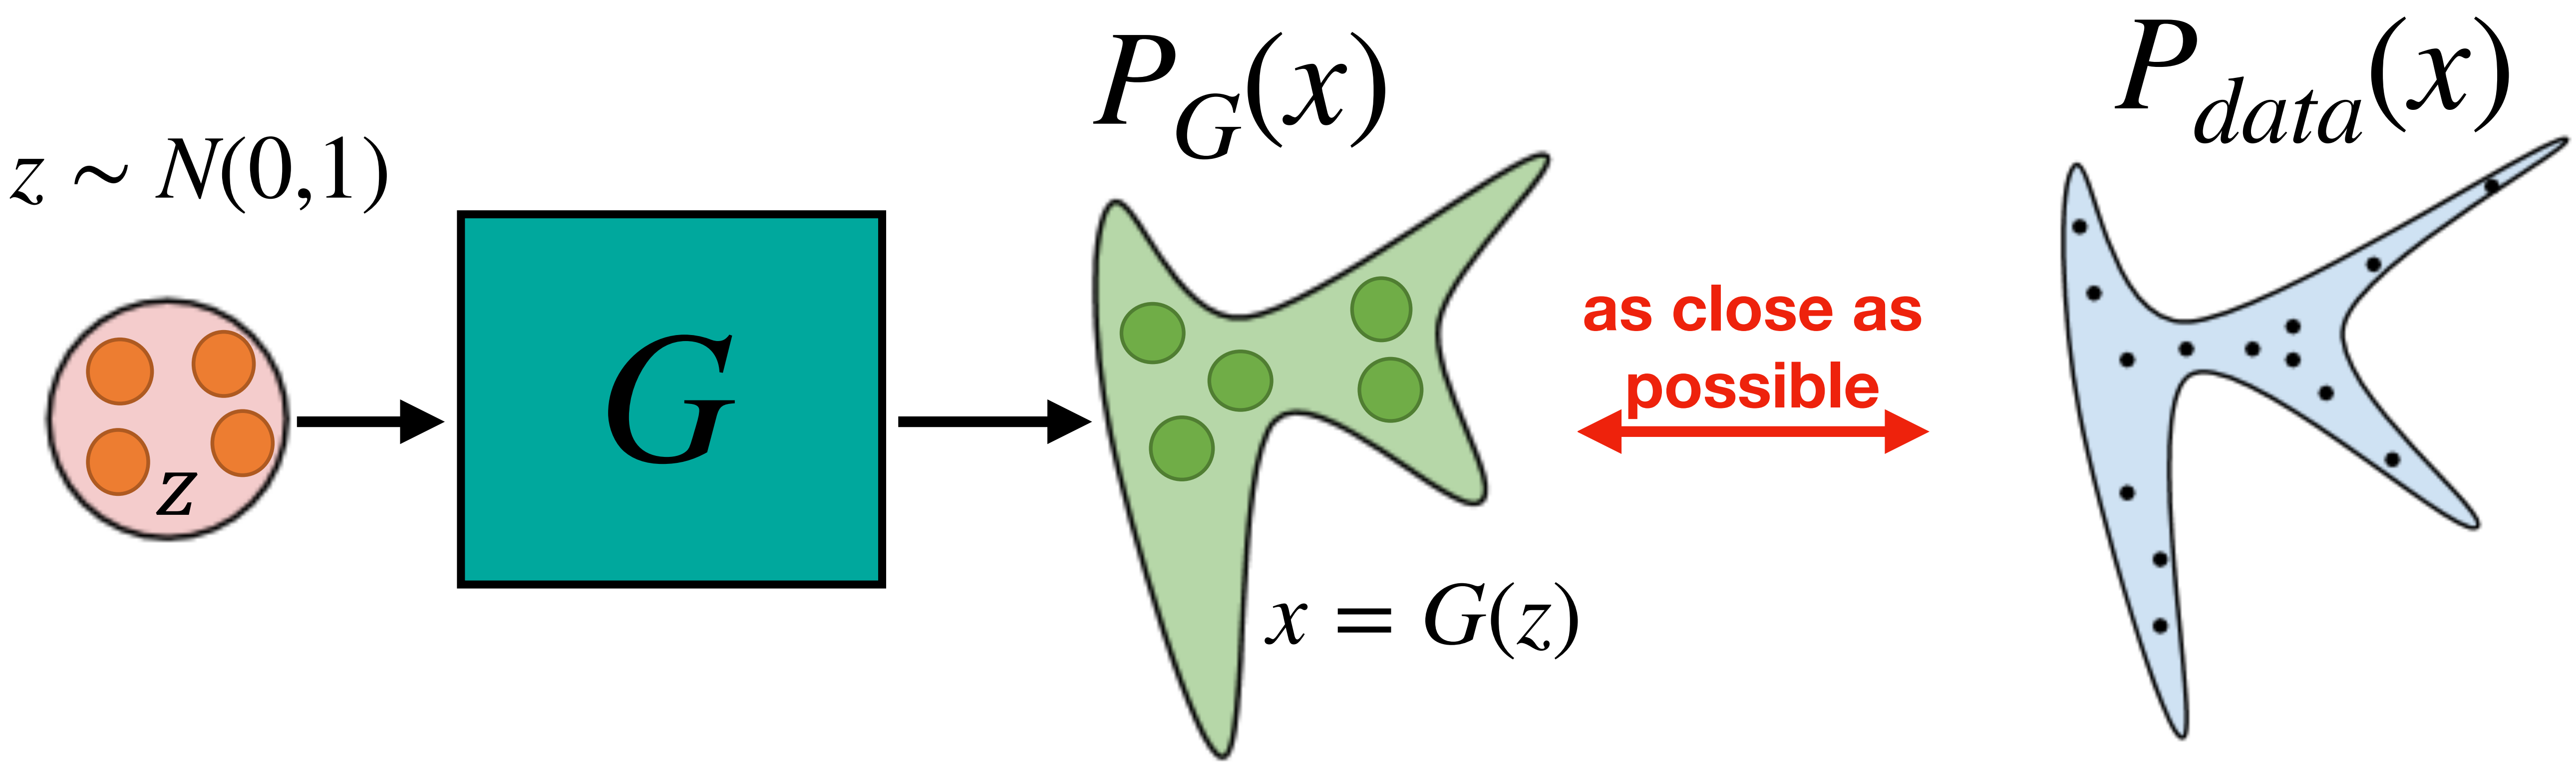
  - Sample m examples $\{x^1, x^2, \dots, x^m\}$ from database
  - Sample m noise samples $\{z^1, z^2, \dots, z^m\}$ from a distribution
  - Obtaining generated data $\{\tilde{x}^1, \tilde{x}^2, \dots, \tilde{x}^m\}$, $\tilde{x}^i = G(z^i)$
  - Update discriminator parameters θ_d to maximize
    - $\tilde{V} = \frac{1}{m}\sum_{i=1}^{m} logD(x^i) + \frac{1}{m}\sum_{i=1}^{m} log\left(1 - D(\tilde{x}^i)\right)$
    - $\theta_d \leftarrow \theta_d + \eta\nabla\tilde{V}(\theta_d)$

Learning G

  - Sample m noise samples$\{z^1, z^2, \dots, z^m\}$ from a distribution
  - Update generator parameters θ_g to maximize
    - $\tilde{V} = \frac{1}{m}\sum_{i=1}^{m} log\left(D\left(G(z^i)\right)\right)$
    - $\theta_g \leftarrow \theta_g - \eta\nabla\tilde{V}(\theta_g)$

Basic idea of GAN

Generator: G is a network. It defines a probability distribution P_G



$$G^* = \arg\min_G \boxed{Div(P_G, P_{data})}$$

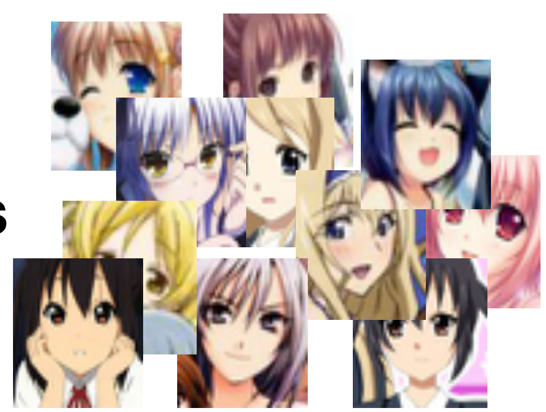
how to compute the divergence between two distributions ?

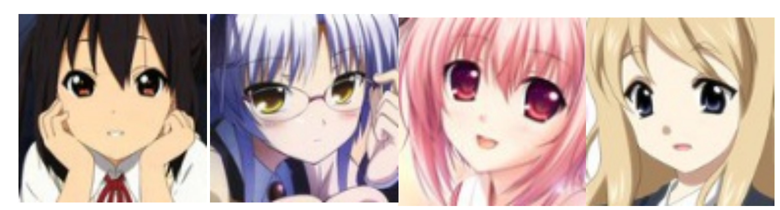
Basic idea of GAN

Discriminator $G^* = \arg\min_G Div(P_G, P_{data})$

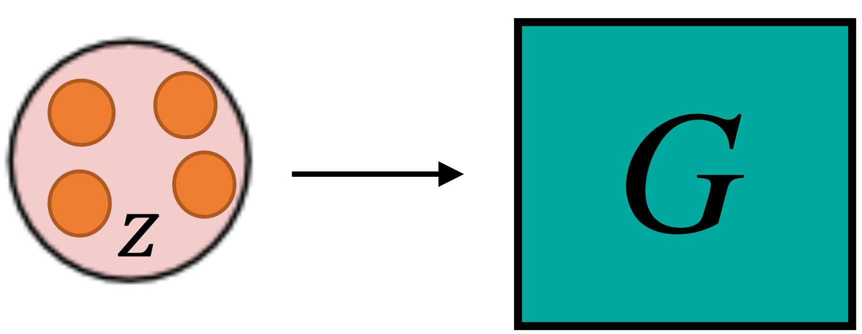
Although we do not know the distributions of $P_G(x)$ and $P_{data}(x)$, we can still sample from them

real images

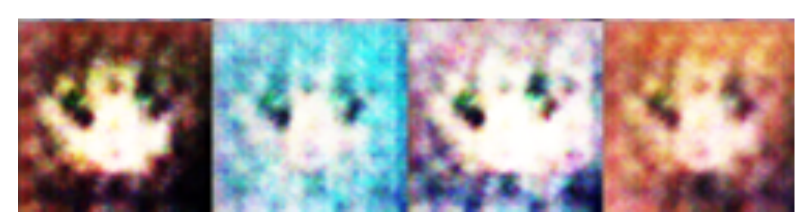




sampling from $P_{data}(x)$



sample from normal distribution



sampling from $P_G(x)$

Basic idea of GAN

Discriminator $$G^* = \arg\min_G Div(P_G, P_{data})$$

Objective function for D

$$V(G,D) = E_{x \sim P_{data}}[logD(x)] + E_{x \sim P_G}[log(1 - D(x))]$$

(G is fixed)

$$D^* = arg\boxed{\max_D \; V(G,D)}$$

= binary classification

JS Divergence

Basic idea of GAN

Discriminator $$G* = \underset{G}{argmin}\ Div(P_G, P_{data})$$

Objective function for G

$$G* = \underset{G}{argmin}(\cancel{E_{x \sim P_{data}}[log D(x)]} + \underline{E_{x \sim P_G}[log(1 - D(G(z)))]})$$

(D is fixed)

$$E_{x \sim P_G}[-log(D(G(z)))])$$

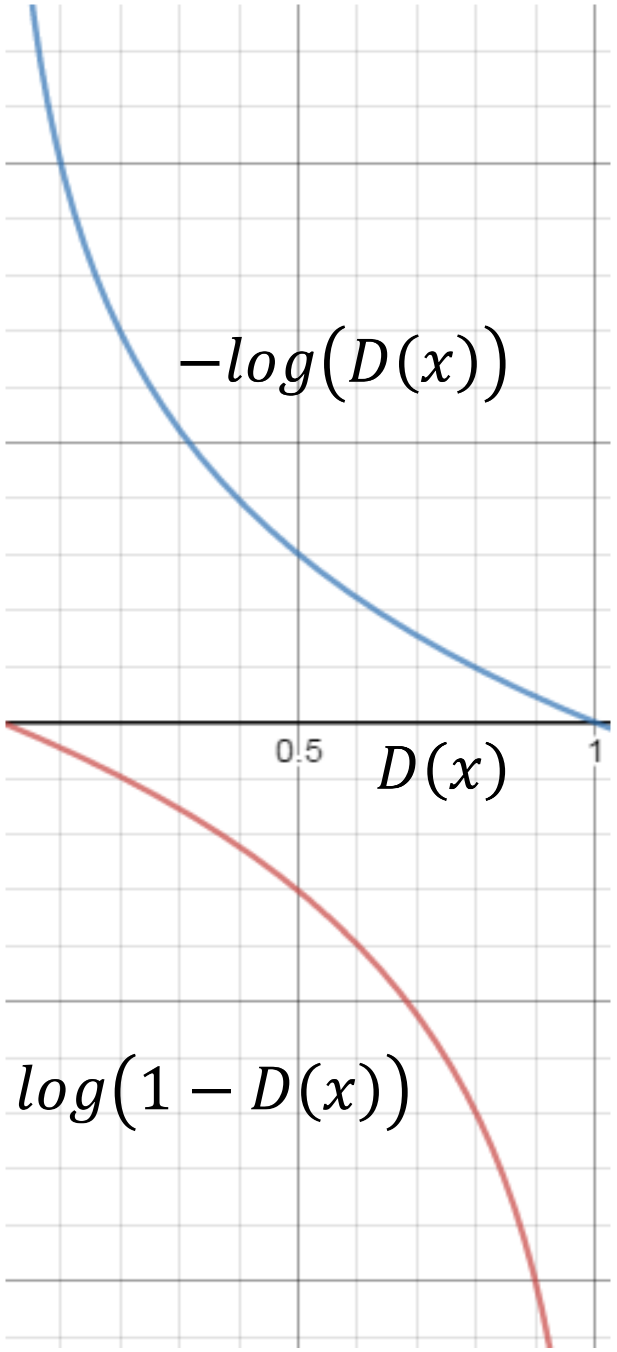
Basic idea of GAN

$$E_{x \sim P_G}[log(D(1 - G(z)))])$$

slow at the beginning

$$E_{x \sim P_G}[-log(D(G(z)))])$$

real implementation



Basic idea of GAN

Different GANs

- **WGAN**
- **WGAN-GP**
- **LSGAN**
- **...**

Basic idea of GAN

$$V(G, D) = E_{x \sim P_{data}}[logD(x)] + E_{z \sim P_z}[log(1 - D(G(z)))]$$

$$G^* = arg\min_G \max_D V(G, D)$$

Training Steps:

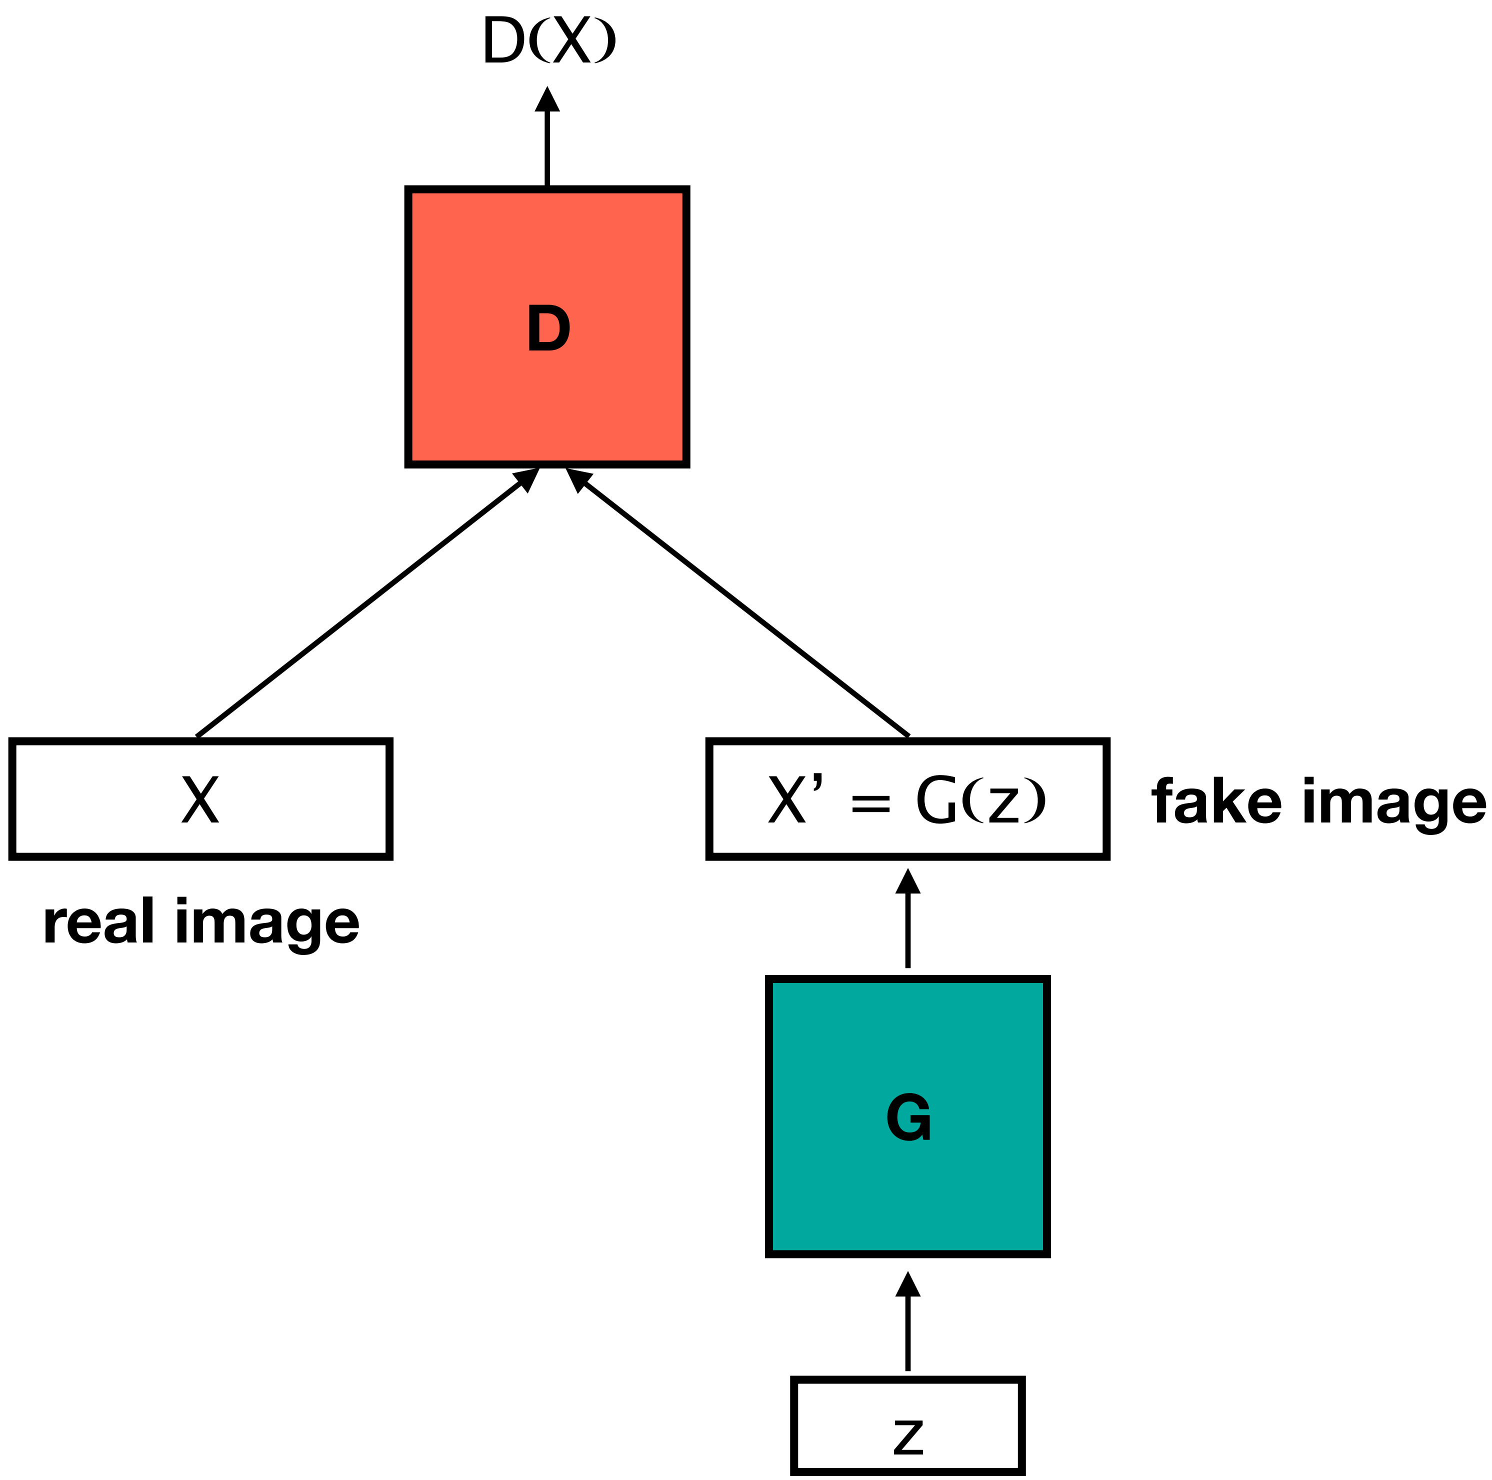
- Initialize Generator and Discriminator
- In each training iteration:

    Step1: Fix Generator G, and update Discriminator D

    Step 2: Fix Discriminator D, and update Generator G

GANs Architecture for Image Generation

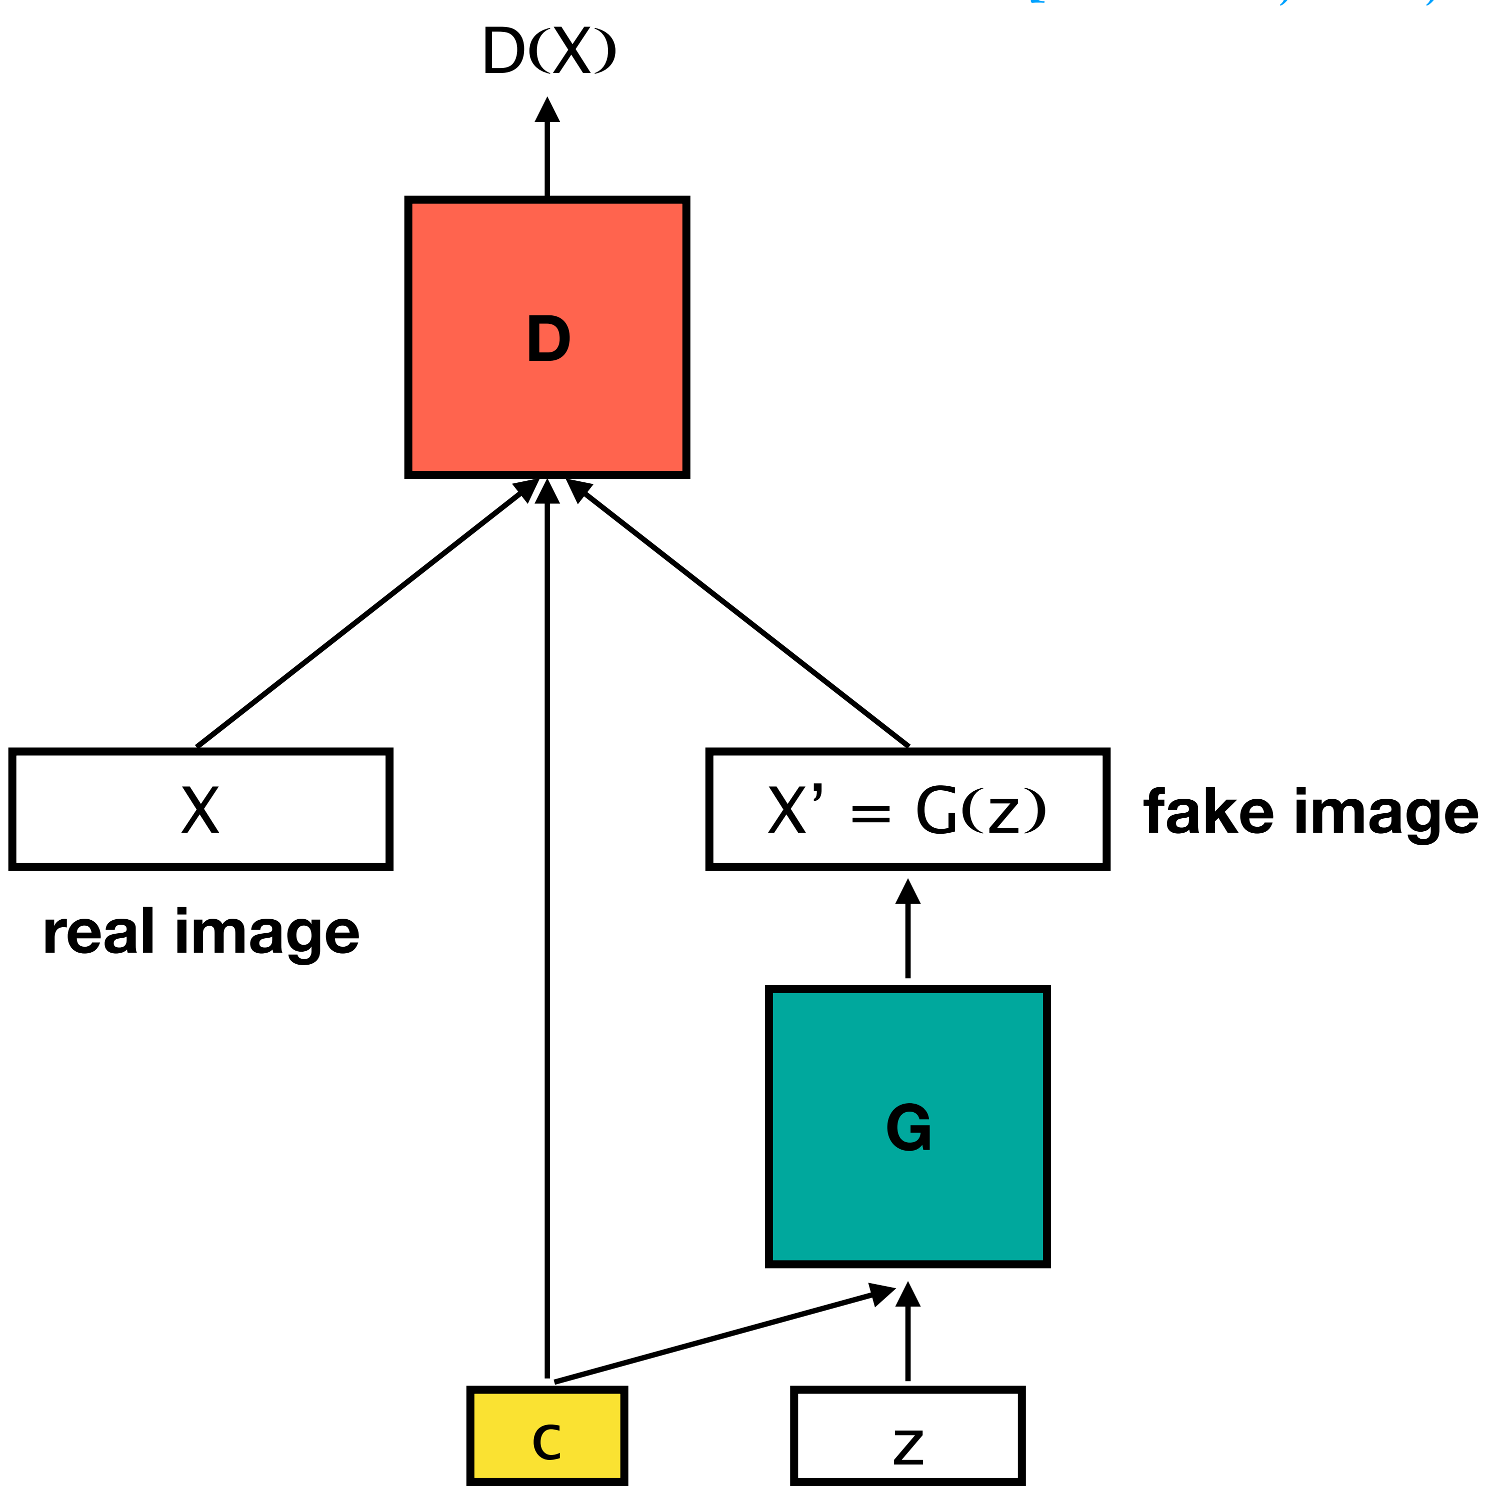
Vanilla GAN [Ian Goodfellow, et al, NIPS 2014]



Conditional GAN

[M Mirza, et al, arXiv 2014]

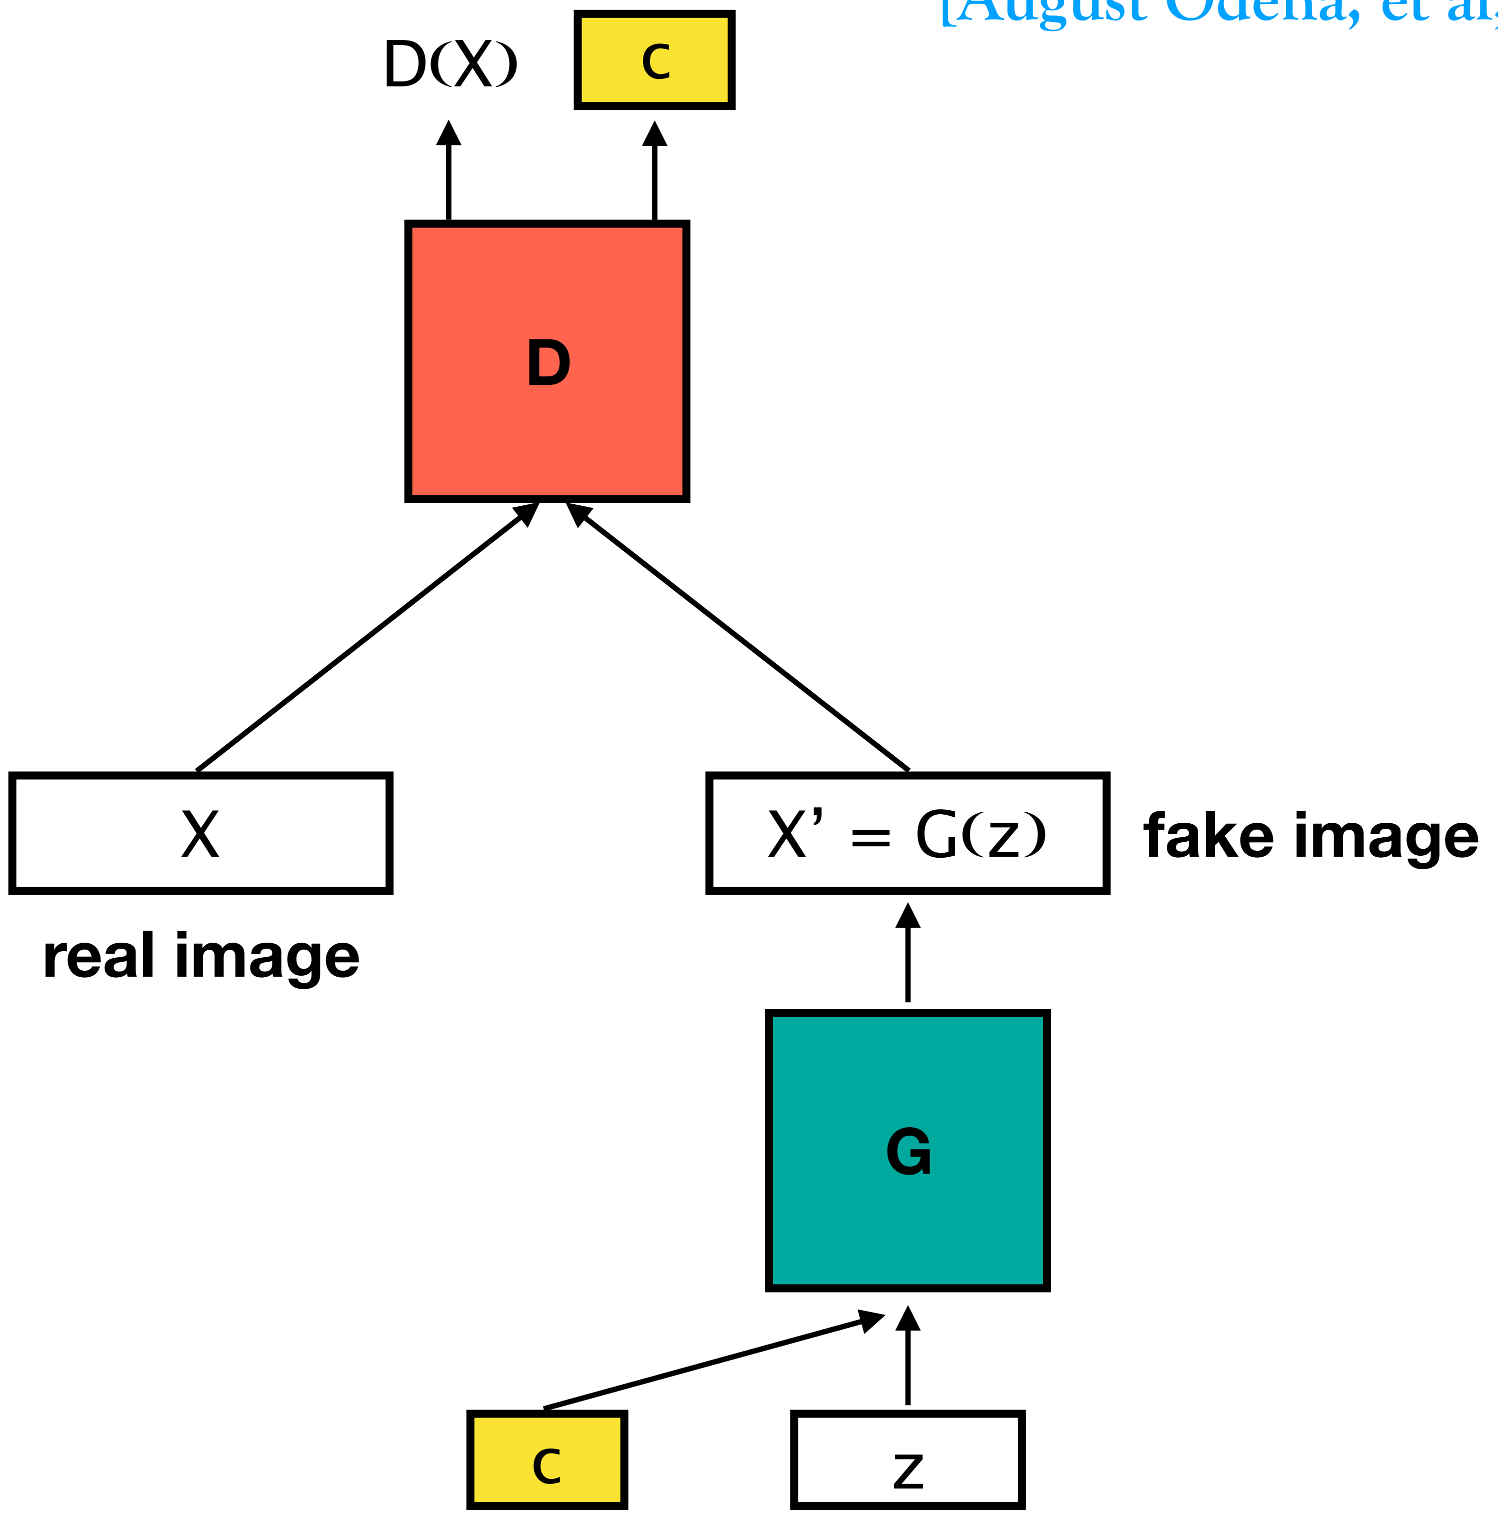
CGAN



Conditional GAN

[August Odena, et al, ICML 2016]

ACGAN



Conditional GAN

Conditional GAN

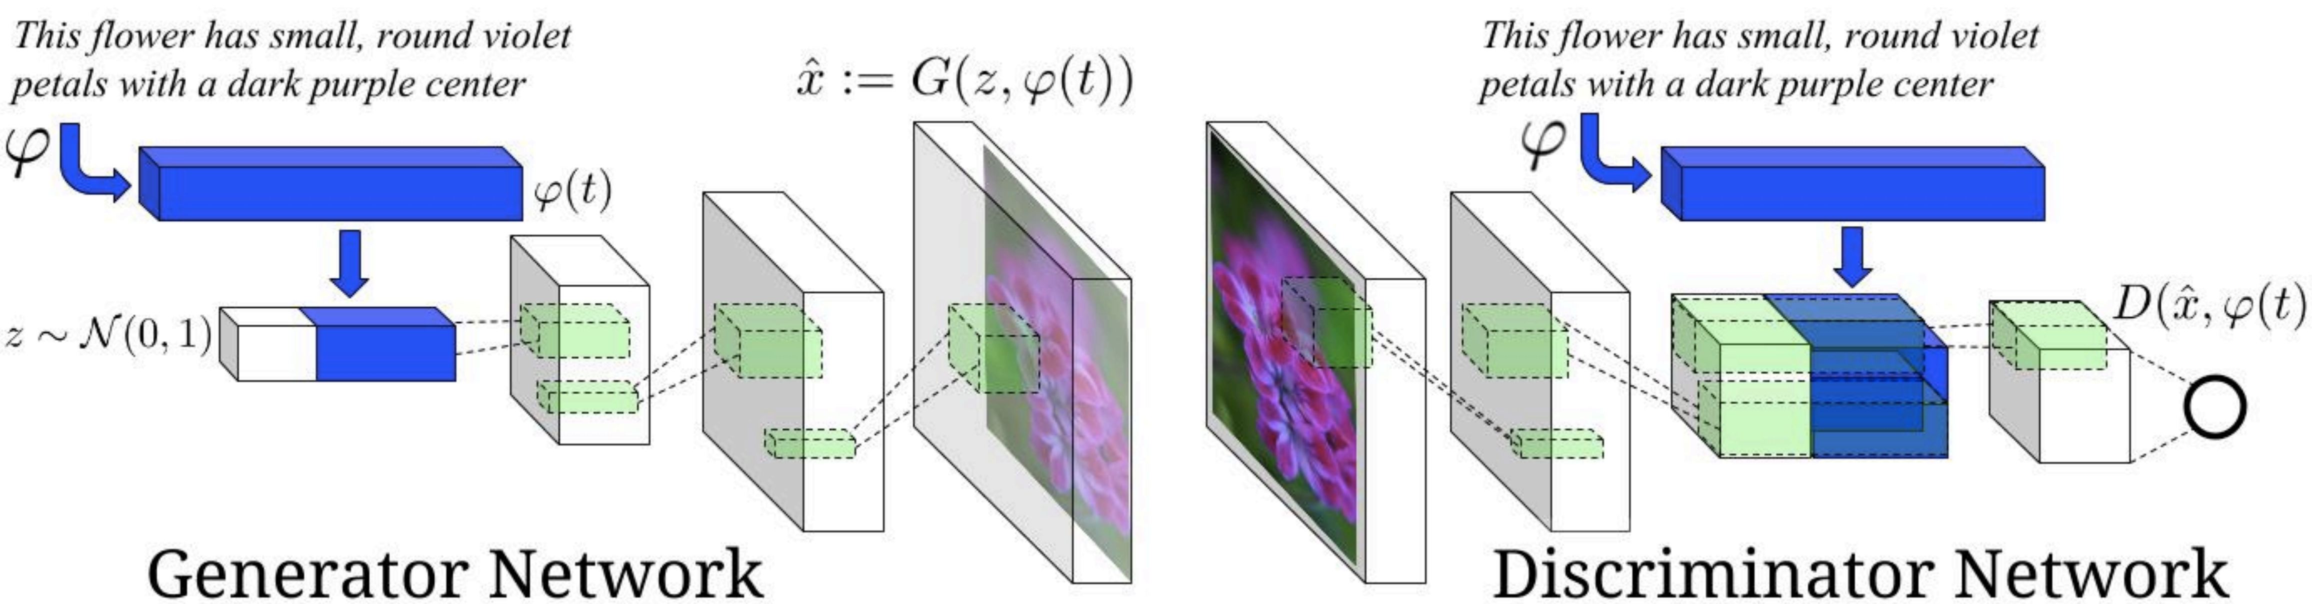
[Scott Reed, et al, ICML 2016]

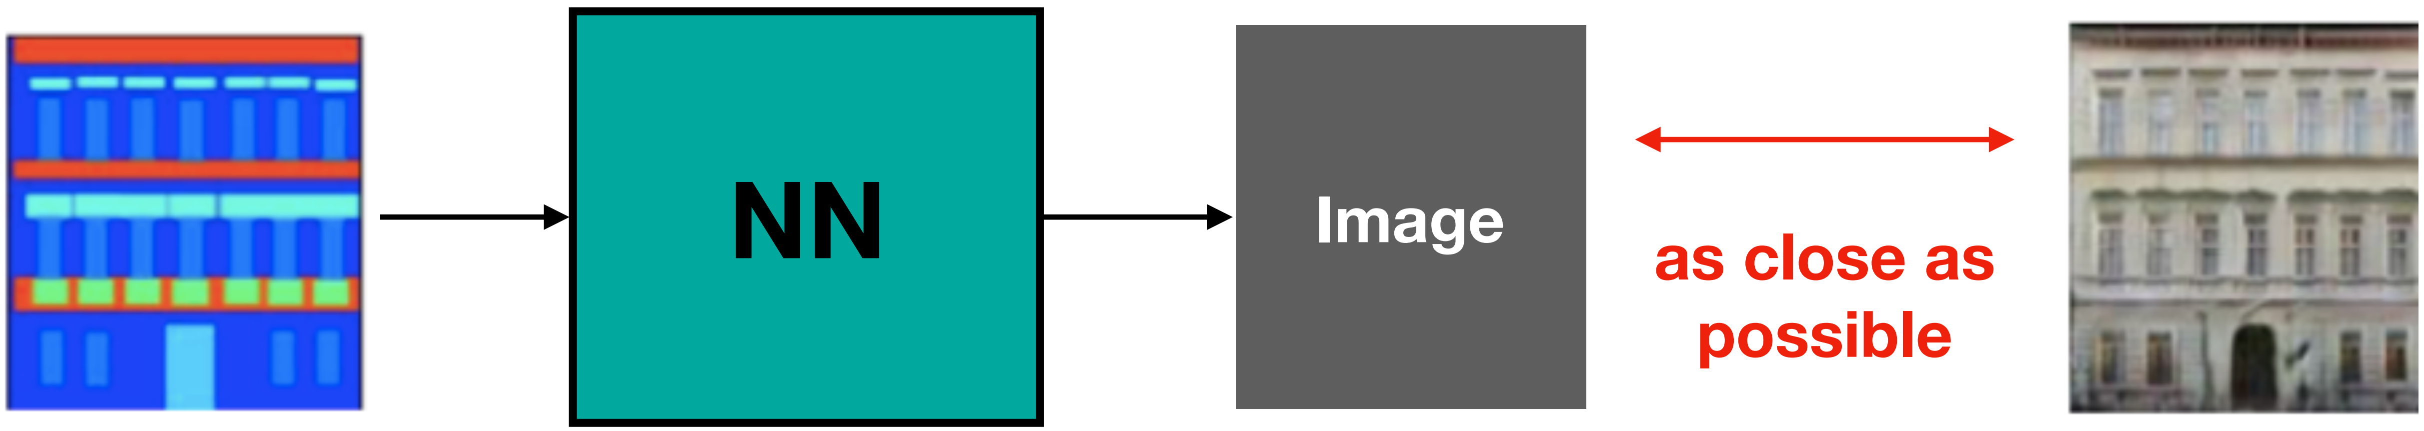
Text-to-image Generation



Conditional GAN

Image-to-image translation

- Traditional method



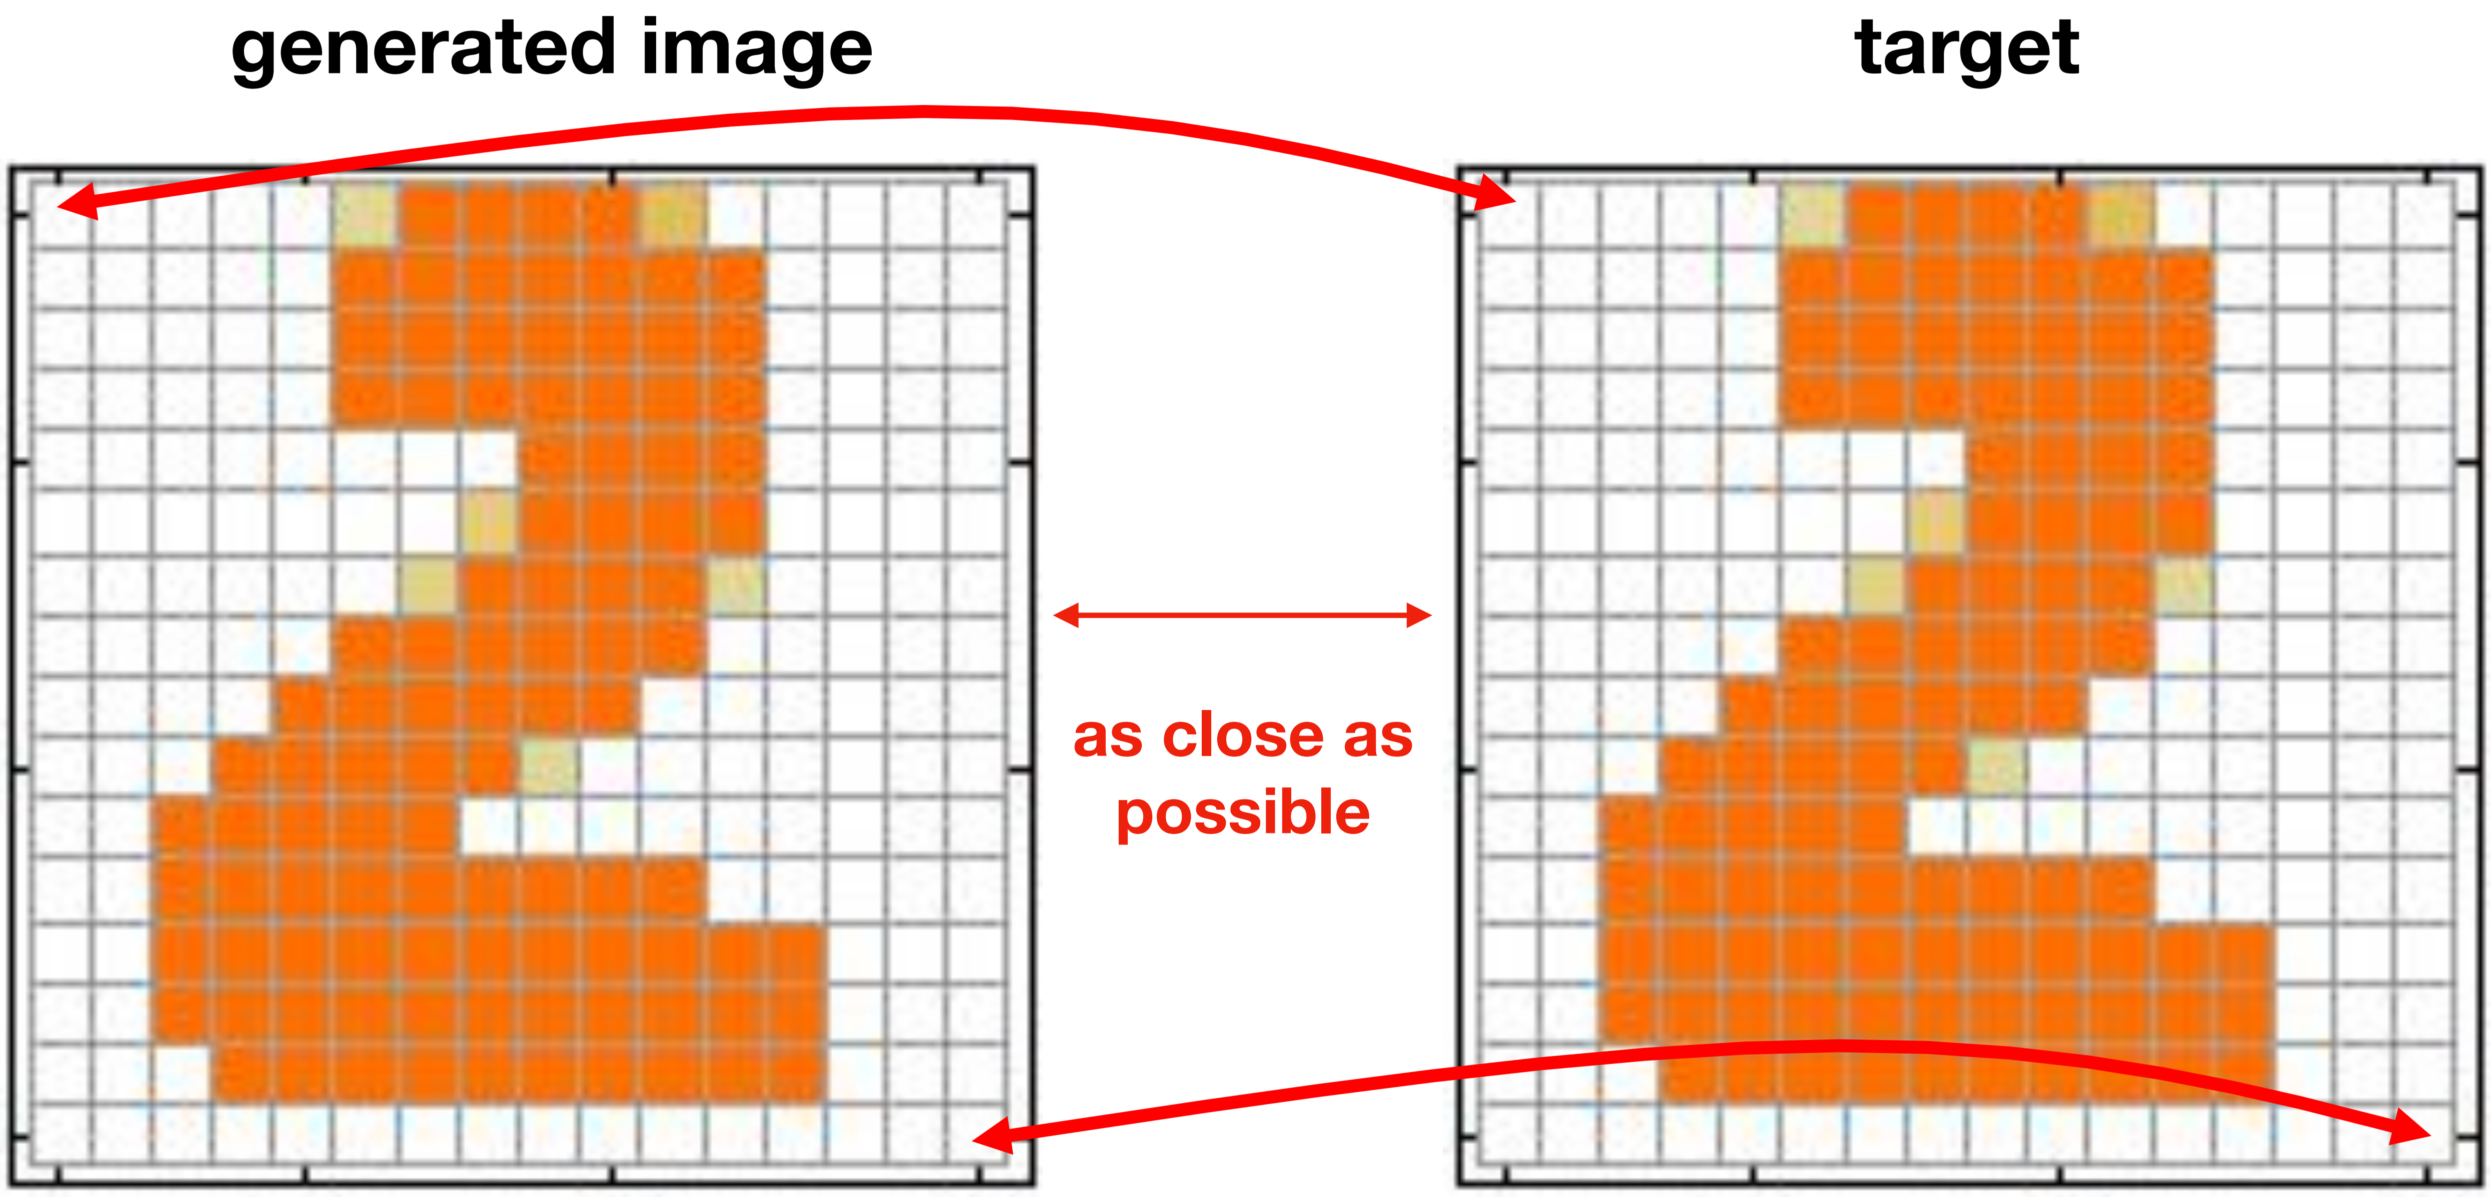
L1 / L2 loss

Testing:

It is blurry,
what is the problem here ?

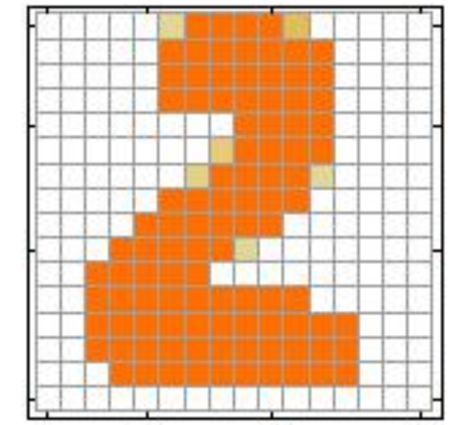
Conditional GAN

Image-to-image translation

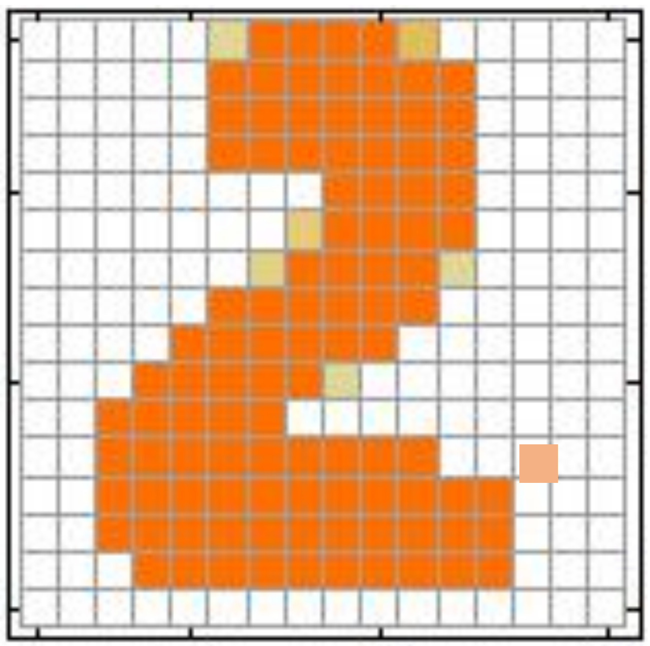


Conditional GAN

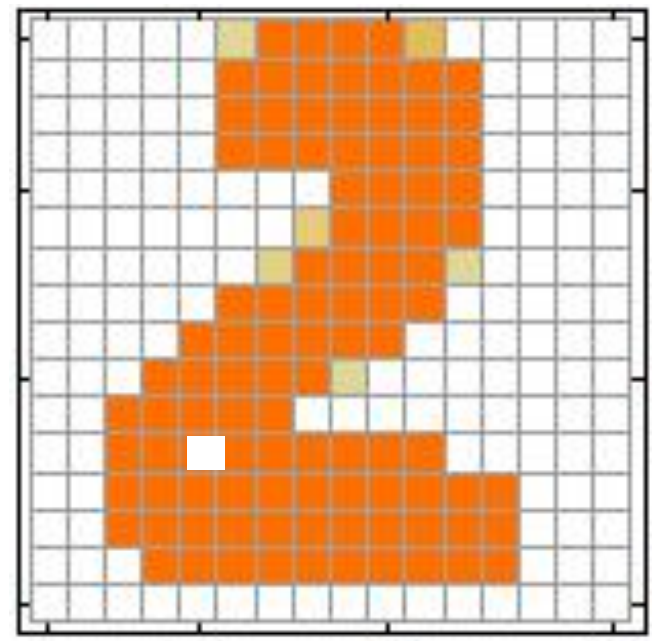
Image-to-image translation



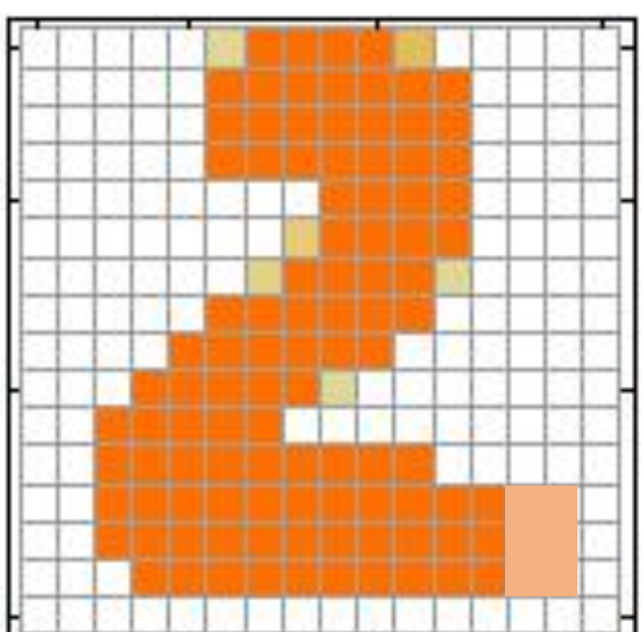
target



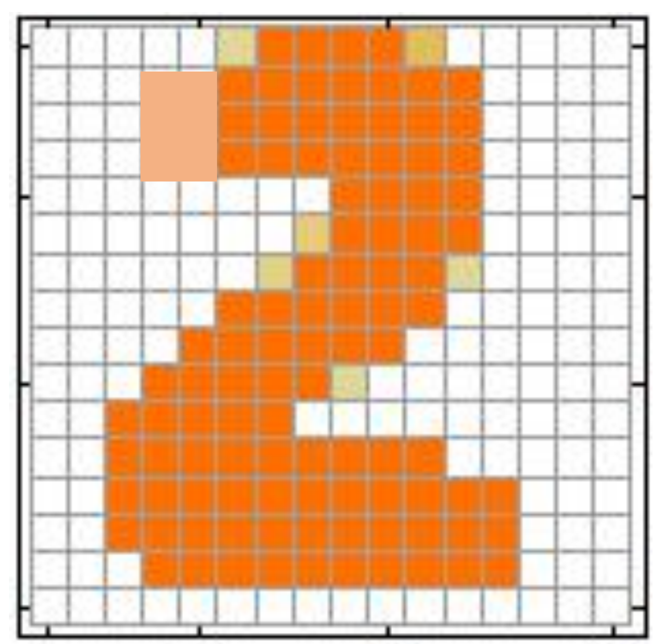
1 pixel error
not realistic



1 pixel error
not realistic



6 pixel error
realistic



6 pixel error
realistic

Conditional GAN

Image-to-image translation

Reconstruction loss can not provide a sharp generation, what should be the solution ?

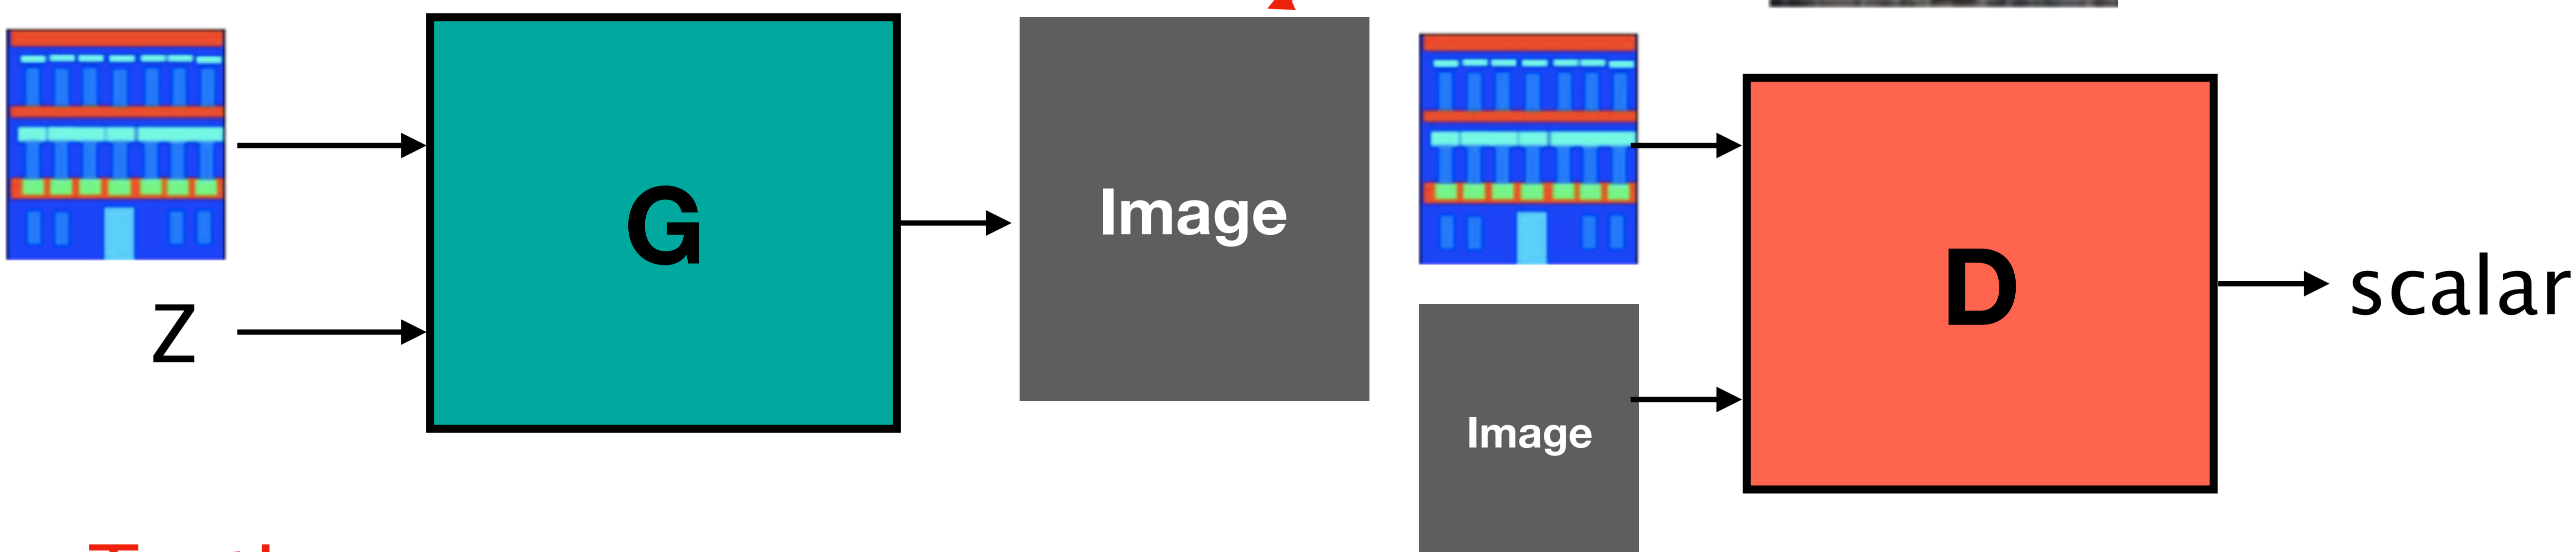
Since we can not find a good metric, we can use GAN to learn the metric !

Conditional GAN

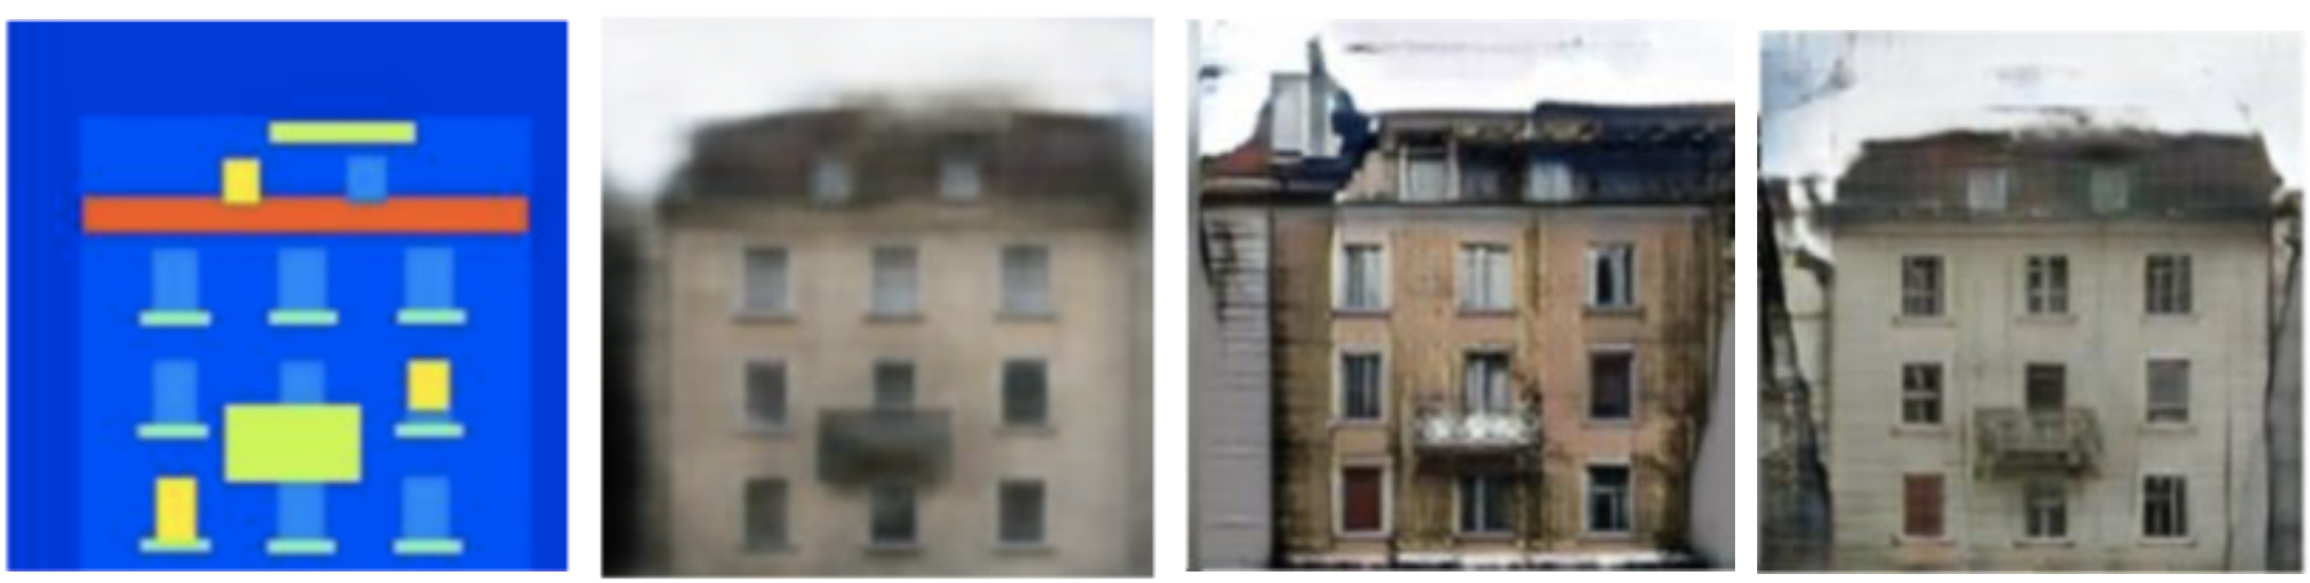
[Phillip Isola, et al, CVPR 2017] Image-to-image translation

- GAN method (Pix2Pix)

as close as possible



Testing:

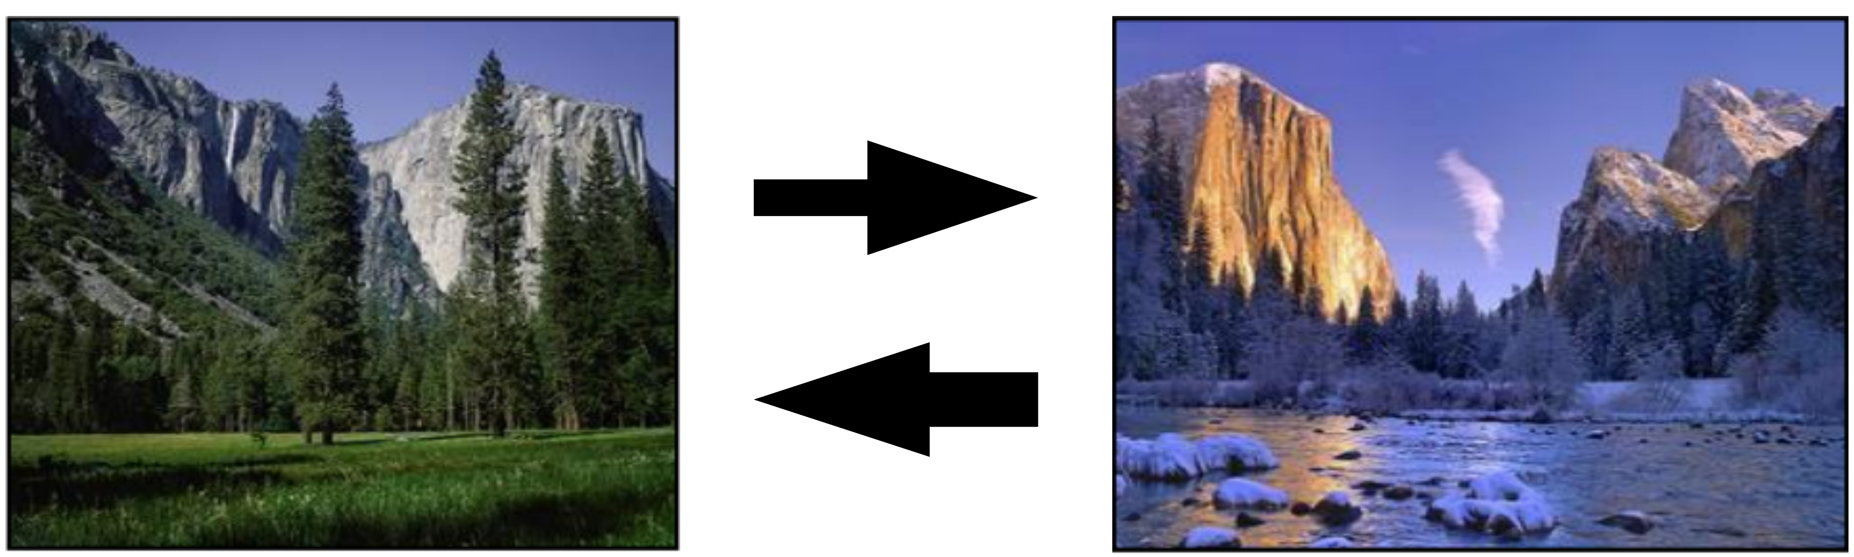


Input **Reconstruct** **GAN** **GAN + Reconstruct**

Image-to-image translation

- What about unpaired data (no ground truth of target image) ?

X: zebra Y: horse



X: summer Y: winter

Image-to-image translation
