

**UML profile for MARTE RFP
(Modeling and Analysis of Real-Time
and Embedded systems)**

INRIA, THALES, CEA

- **Modeling**
 - **Behavior / Operational Semantics** of applications (Software)
 - Structural description of implementation platforms (Hardware)
 - Allocation
- **Complement works on ADL modeling**
 - AADL, SysML, UML4SoC
- **... and beyond the profile**
 - Create an environment for analysis, optimization, validation/test, code generation for Embedded Systems

- **UML Profile for modeling and analysis of real-time and eMBEDDED (MARTE) systems including its software and hardware aspects**
 - The Proposals will define a UML profile
 - Relying on a conceptual model definition
 - It shall be possible to use independently software and hardware parts of the profile
 - It shall comply with standards
 - UML 2.0
 - UML profiles for QoS&FT, Testing
 - Forthcoming UML profile for SE (SysML)
 - **It shall update the SPT profile 1.1**

MARTE Profile architecture

Requirements for TCR category: **Time, Concurrency and Resources (1/2)**

■ Time models

- Asynchronous / **Synchronous** (discrete) / Real-time
 - Asynchronous/Causal
 - **Synchronous/Clocked: simultaneity, priority**
 - **Real-time/Continuous:** time and performance specification, measurement

■ Clock synchronization for concurrent applications

Requirements for TCR category: Time, **Concurrency** and **Resources** (2/2)

- Define modeling entities to specify tasking models
- Support concurrency models
- Support for deployment
 - *software on hardware, application on tasking models*

-
- Resources model to provide an abstract view of hardware architecture
 - Define high-level modeling constructs for factorization of repetitive structures (*for both hardware and software*)

- **Support for modeling different kinds of duration model**
 - WCET, BCET, ACET, etc.

- **Support for describing parameterized expressions for performance and schedulability annotations**
 - QoS, Scheduling policy

- **Support for multiple delay requirements for any timing interval**
 - Deadline, percentile, mean, variance, distribution, etc.

- **Shall define specific embedded QoS**
 - **power consumption**, program size, data size, **memory budget**, etc.

- **Support at least fully static resources allocation to the application:**
 - For applications completely known at compile-time,
 - Where processing does not depend on consumed data

- Provide the means to specify **models of computation (MoC)**, in relation to a specific time model from the TRC sub-profile, for **data-flow and control-flow**, *and their interactions*
 - Synchronous reactive, Discrete time, Synchronous dataflow, ...
- Support fully **deterministic behavior modeling**
 - Reproducible behavior amenable to formal analysis

- **High-level modeling constructs for factorization of repetitive structures** for both hardware and software, and their allocation
- **Support allocation modeling on hardware abstractions**
 - software portability and reuse across hardware devices
- **Support component-based RTE hardware architecture modeling, using TCR hardware resource models**

RTEM category: **Illustration of requirement #23**

- **Field: intensive computation embedded systems**
 - Lots of computations, possibly in parallel
 - Several computation units
- **Applications domains**
 - Signal processing, image processing, mobile devices
- **Concepts**
 - Repetition of structural elements (possibly multi-dimensional)
 - Topological description of relations between repeated elements
 - Compact expression
- **Unique factorization mechanisms for modeling**
 - Hardware: available parallelism
 - Application: potential parallelism
 - Allocation relationships

- RFP voted at Burlingame (February 2005)
- LOI: June 05 (Boston meeting)
- Initial submission: November 05
- Revised submission: June 06
- Vote : September 2006
