

# Optical illusions and their influence on machine vision

Paula Crăciun, AYIN team

You don't only need eyes to see,  
you need vision!

- Vision = set of processes that makes sense of the information acquired through the visual system

You certainly know that ...  
a digital camera is the eye of a  
machine vision system

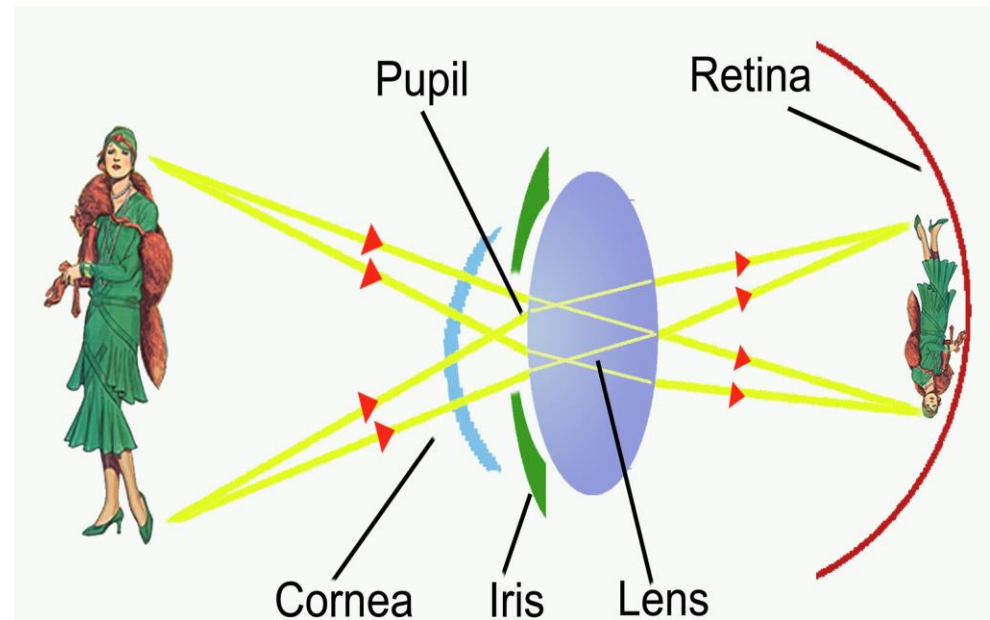

- The functioning of digital camera can be easily compared with the functioning of a human eye
- Both convert light waves into electric signals

But did you also know that ...  
knowledge about the human visual  
system is essential for building a  
machine vision system?

- Hardware structures and software: same principles as human vision works
- Artificial visual perception is increasingly used in industrial automation, non-industrial automated processes and even in our everyday life

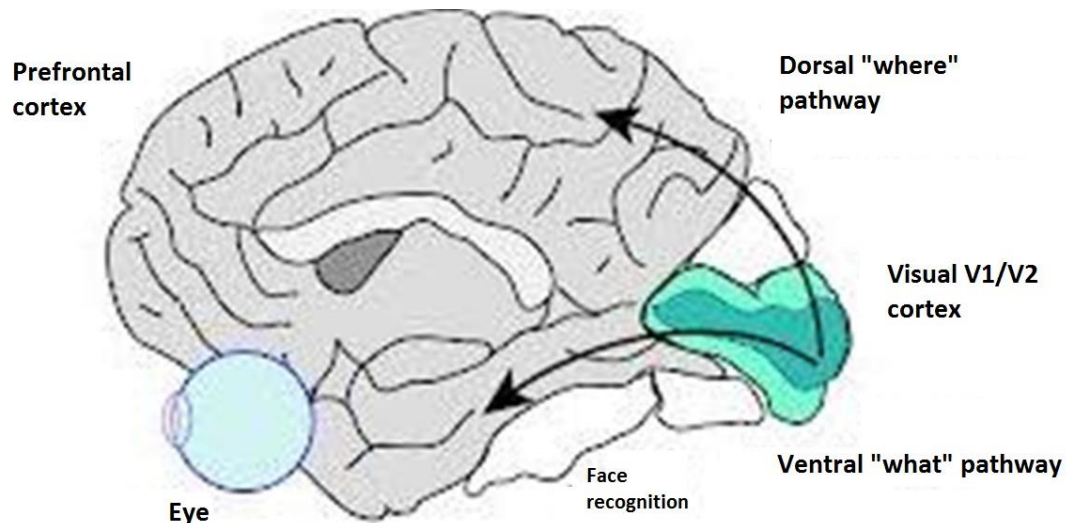

# A little on the human visual system ...

- Light is captured through the eyes and converted in electrochemical signals

# A little more on the human visual system ...

- Signals are sent by the optical nerve via the thalamus to the cortex where the visual perception occurs

Visual input -> Processing -> Unconscious mind -> Mental awareness

# A little more on the human visual system ...

- Signals are sent by the optical nerve via the **thalamus** to the cortex where the visual perception occurs

Visual input -> Processing -> Unconscious mind -> Mental awareness

# Even more on the human visual system ...

- Almost all higher order features of vision are influenced by expectations based on past experience

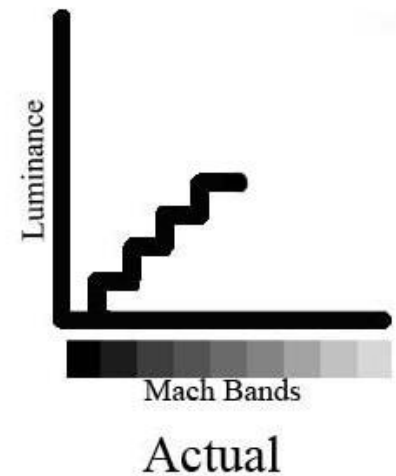

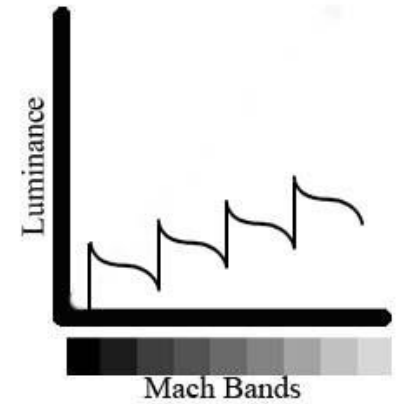

# Expectations lead to (optical) illusions

- Optical illusions = visually perceived images that differ from the reality

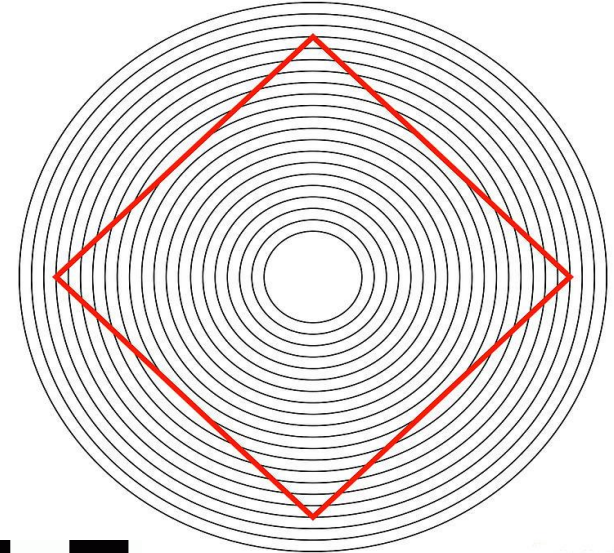

# Hermann Grid

# Mach bands

# Geometric illusions

# More interesting illusions ...

**Mars Tomb**

**Kofun Era Tomb**

# Applications in face recognition

# Applications in image understanding

# Applications in object detection

# Applications to object recognition

# Optical illusions lead to a better understanding of the human vision system

- Why? Because we can identify the patterns our mind implicitly uses for understanding images

# Better understanding of the human vision system leads to better machine vision

- Why? Because we can develop biology inspired algorithms
- Is there a better vision system than our own?

# Additional information

- Great website with lots of visual illusions

<http://www.michaelbach.de/ot/index.html>

- Awesome Ted Talk

[http://blog.ted.com/2009/10/08/optical\\_illusio/](http://blog.ted.com/2009/10/08/optical_illusio/)

Thnak you for yuor attnetoin!
