Contents

Foreword

PART I. Introduction and background

1. The quest for correctness, Henk Barendregt
2. Representing proofs and statements, Bengt Nordström
3. Pure Type Systems, Herman Geuvers
4. Inductive definitions and Type Theory, Thierry Coquand

PART II. Systems

1. The Agda system, Catarina Coquand and Thomas Hallgren
2. The Coq system, Benjamin Werner
3. The Isabelle system, Tobias Nipkow (tutorial given separately)
4. The Lego system, Zhaohui Luo (user's manual given separately)

PART III. Avanced topics

1. The semantic significance of computation, Per Martin-Löf (not included)
2. Lambda-calculus and ZF, Jean-Louis Krivine
3. Linear logic and computer science, Yves Lafont
4. Program extraction in 2nd order classical logic, Michel Parigot (given separately)
5. Types and program optimization, Stefano Berardi
6. A quick overview of PVS and HOL, Laurent Théry (not included)

PART IV. Applications

1. Formal verification in industry, John Harrison (forthcoming paper)
2. Proofs of correctness of protocols , Jaco van de Pol
3. Certified computer algebra , Henrik Persson
4. Tobias Nipkow: Formalizing and analyzing Java in Isabelle/HOL (not included)
5. Linguistic applications of type theory, Aarne Ranta
