## Infinite Regular Languages Exercise

M1 Master Info $-\ 2021$ 

## Exercise 1

Show that  $L=\{w\in \Sigma^\omega\mid |w|_{\mathtt{a}}\neq\infty\}$  is not recognised by any DBA.

Hint: For a proof by contradiction, suppose DBA  $\mathcal{A}$  recognises L and consider runs on the family of words  $w_0 = ab^{\omega}$ ,  $w_1 = ab^{i_0}ab^{\omega}$ ,  $w_2 = ab^{i_0}ab^{i_1}ab^{\omega}$ , ..., for a carefully chosen *i*'s. Reason then that  $w = ab^{i_0}ab^{i_1}ab^{i_2}a\cdots \in L(\mathcal{A})$ .

## Exercise 2

Show that for every NFA  $\mathcal{A}$  with  $\epsilon \notin L(\mathcal{A})$ , there exists a NBA  $\mathcal{B}$  s.t.  $L(\mathcal{B}) = L(\mathcal{A})^{\omega}$ .

Hint: The NFA construction for  $L(A)^*$  does not work, see the following counter example. To overcome this introduce a fresh, single final state in the construction.

 $L(\mathcal{A}) = ab^* \qquad \qquad L(\mathcal{B}) = a(a+b)^{\omega} \neq L(\mathcal{A})^{\omega}$
