Pursuit-Evasion Games

2-Player games

A team of mobile entities (Cops) track down another mobile entity (Robber)

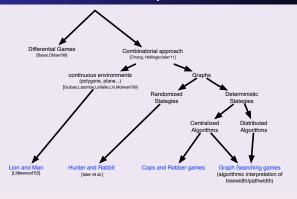

Always one winner

- Combinatorial Problem:
 Minimizing some resource for some Player to win e.g., minimize number of Cops to capture the Robber.
- Algorithmic Problem:
 Computing winning strategy (sequence of moves) for some Player
 e.g., compute strategy for Cops to capture Robber/Robber to avoid the capture

natural applications: coordination of mobile autonomous agents
(Robotic, Network Security, Information Seeking...)
but also: Graph Theory, Models of Computation, Logic, Routing...

Pursuit-Evasion: Over-simplified Classification

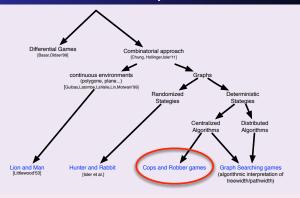

Pursuit-Evasion: Over-simplified Classification

[Chung, Hollinger, Isler'11]

《四》《圖》《意》《意》。 意

Pursuit-Evasion: Over-simplified Classification

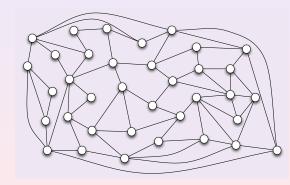

Today: focus on Cops and Robber games

Goal of this talk: illustrate that studying Pursuit-Evasion games helps

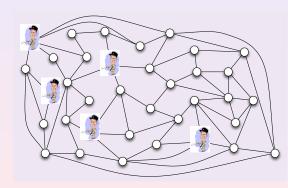

- Offer new approaches for several structural graph properties
- Models for studying several practical problems
- Fun and intriguing questions

3/18

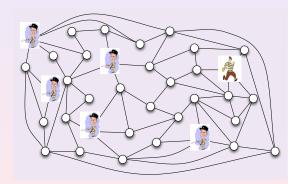

Rules of the $\mathcal{C}\&\mathcal{R}$ game

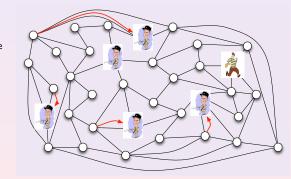

1 Place $k \ge 1$ Cops $\mathcal C$ on nodes

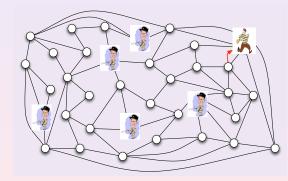

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node

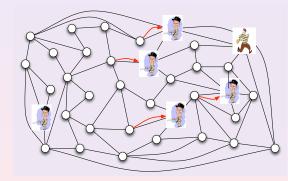

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node
- 3 Turn by turn (1) each C slides along ≤ 1 edge

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node
- Turn by turn
 - (1) each $\mathcal C$ slides along ≤ 1 edge
 - (2) ${\cal R}$ slides along ≤ 1 edge

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node
- Turn by turn
 - (1) each $\mathcal C$ slides along ≤ 1 edge
 - (2) ${\cal R}$ slides along ≤ 1 edge

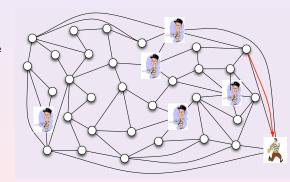

Rules of the $\mathcal{C}\&\mathcal{R}$ game

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node
- Turn by turn
 - (1) each $\mathcal C$ slides along < 1 edge
 - (2) ${\mathcal R}$ slides along ≤ 1 edge

Goal of the C&R game

Robber must avoid the Cops

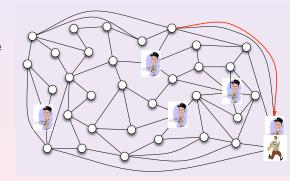

Rules of the $\mathcal{C}\&\mathcal{R}$ game

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node
- Turn by turn
 - (1) each $\mathcal C$ slides along < 1 edge
 - (2) $\mathcal R$ slides along ≤ 1 edge

Goal of the C&R game

- Robber must avoid the Cops
- Cops must capture Robber (i.e., occupy the same node)

Rules of the $\mathcal{C}\&\mathcal{R}$ game

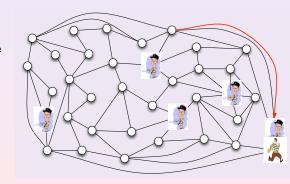

- ① Place $k \ge 1$ Cops \mathcal{C} on nodes
- 2 Visible Robber \mathcal{R} at one node
- Turn by turn
 - (1) each \mathcal{C} slides along ≤ 1 edge
 - (2) ${\cal R}$ slides along ≤ 1 edge

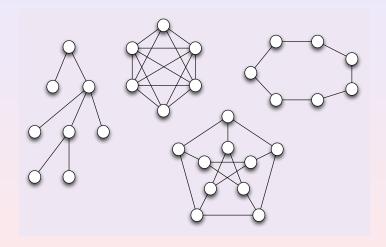

Goal of the C&R game

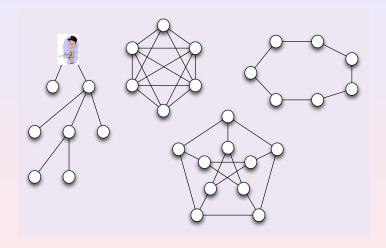

- Robber must avoid the Cops
- Cops must capture Robber (i.e., occupy the same node)

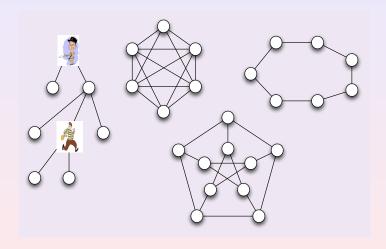

Cop Number of a graph G

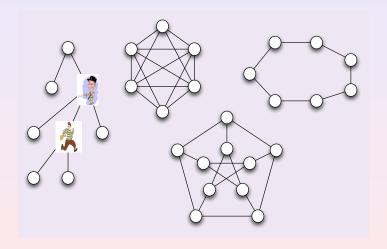

cn(G): min # Cops to win in G

Graphs with high cop-number

Large girth (smallest cycle) AND large min degree ⇒ large cop-number

G with min-degree d and girth $> 4 \Rightarrow cn(G) \ge d$.

[Aigner and Fromme 84]

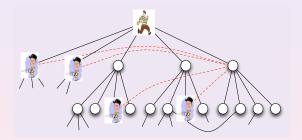

- for any k, d, there are d-regular graphs G with $cn(G) \ge k$ [Aigner and Fromme 84]
- o () 2 d many graph with min-degree d and girth > 0t 3 [Main of]
- for any k, there is G with diameter 2 and $cn(G) \ge k$ (e.g., Kneser graph $KG_{3k,k}$

Graphs with high cop-number

Large girth (smallest cycle) AND large min degree \Rightarrow large cop-number

G with min-degree d and girth $> 4 \Rightarrow cn(G) \ge d$.

[Aigner and Fromme 84]

- for any k, d, there are d-regular graphs G with $cn(G) \ge k$ [Aigner and Fromme 84]
- ullet $cn(G) \geq d^t$ in any graph with min-degree d and girth > 8t-3 [Frankl 87]
- lack online for any k, there is G with diameter 2 and $cn(G) \geq k$ (e.g., Kneser graph $KG_{3k,k}$)

Meyniel Conjecture

\exists *n*-node graphs with degree $\Theta(\sqrt{n})$ and girth > 4

 $\Rightarrow \exists$ *n*-node graphs *G* with $cn(G) = \Omega(\sqrt{n})$ (e.g., projective plan, random \sqrt{n} -regular graphs)

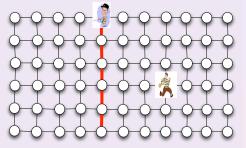

Meyniel Conjecture

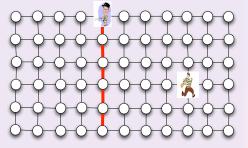

Conjecture: For any *n*-node connected graph G, $cn(G) = O(\sqrt{n})$

[Meyniel 85]

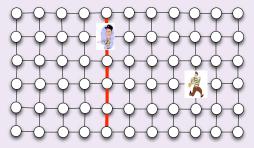

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

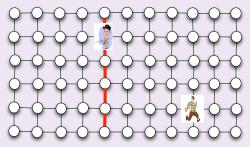

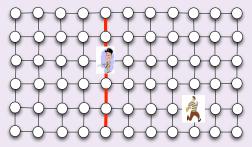

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

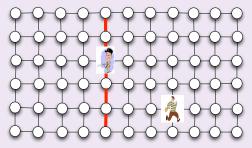

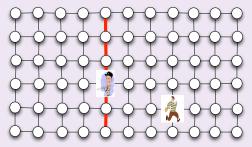

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

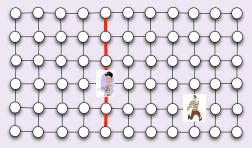

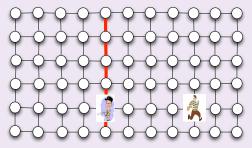

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

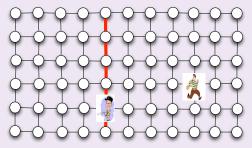

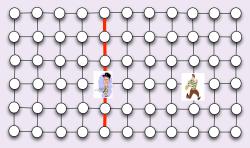

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

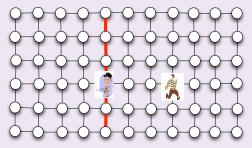

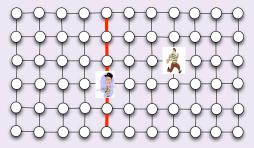

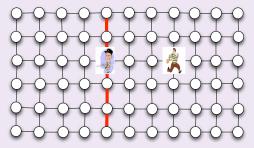

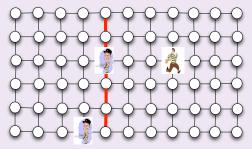

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

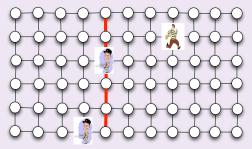

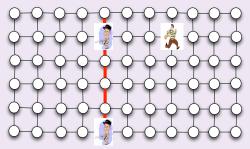

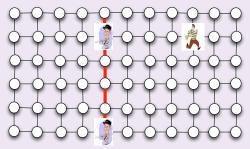

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

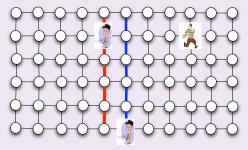

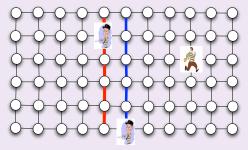

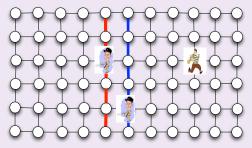

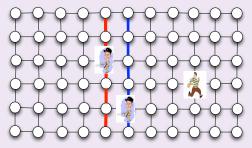

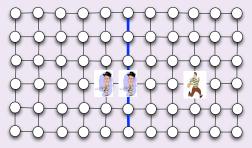

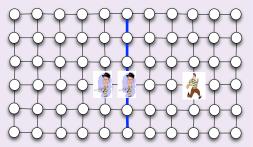

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

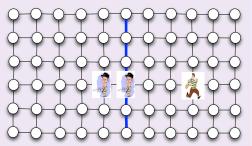

Lemma [Aigner, Fromme 1984]

1 Cop is sufficient to "protect" a shortest path P in any graph. (after a finite number of step, Robber cannot reach P)

 \Rightarrow cn(grid) = 2 (while $\gamma(grid) \approx n/2$)

Link with Graph Structural Properties

Reminder: For any graph G, $cn(G) \le \gamma(G)$ the dominating number of G.

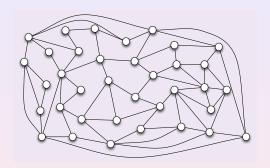

Lemma [Aigner, Fromme 1984]

1 Cop is sufficient to "protect" a shortest path P in any graph. (after a finite number of step, Robber cannot reach P) $\Rightarrow cn(grid) = 2 \text{ (while } \gamma(grid) \approx n/2)$

⇒ Cop-number related to both structural and metric properties

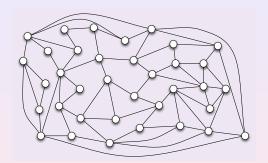

1 Cop can protect 1 shortest path: applications (1)

Cop-number vs. graph structure

a surprising (?) example

1 Cop can protect 1 shortest path: applications (1)

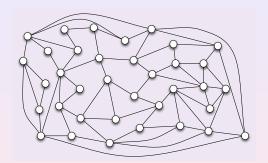

For any planar graph G (there is a drawing of G on the plane without crossing edges), there exists separators consisting of ≤ 3 shortest paths

Cop-number vs. graph structure

a surprising (?) example

1 Cop can protect 1 shortest path: applications (1)

(1) start in a node (2) greedily extend along induced path (3) "retract" when useless

A simple universal strategy

(Cops must occupy an **induced** path)

 $(1) \ start \ in \ a \ node \ (2) \ greedily \ extend \ along \ \textbf{induced path} \ (3) \ "retract" \ when \ useless$

Key point 1: aim at Neighborhood[Cops] induces a separator (grey nodes "protected") Key point 2: use k Cops only if there is an induced cycle of length $\geq k+1$

A simple universal strategy

(Cops must occupy an **induced** path)

 $(1) \ start \ in \ a \ node \ (2) \ greedily \ extend \ along \ \textbf{induced path} \ (3) \ "retract" \ when \ useless$

Key point 1: aim at Neighborhood[Cops] induces a separator (grey nodes "protected") Key point 2: use k Cops only if there is an induced cycle of length $\geq k+1$

Theorem

[Kosowski,Li,N.,Suchan, ICALP'12, Algorithmica]

 $cn(G) \le k-1$ in any graph G with maximum induced cycle of length k (k-chordal)

...to a Structural Result and Applications to Compact Routing

Recursive decomposition using separators with short dominating induced path

Theorem

[Kosowski, Li, N., Suchan, ICALP'12, Algorithmica]

There is a $O(m^2)$ algorithm that, for any graph G with m edges and max degree Δ ,

- either returns an induced cycle of length $\geq k+1$,
- or compute a tree-decomposition with width $\leq (k-1)(\Delta-1)+2$.

Applications

[Kosowski,Li,N.,Suchan, ICALP'12, Algorithmica

 $tw(G) = O(\Delta \cdot k)$ if G has no induced cycle of length > k. improve the bound $tw(G) = O(\Delta^{O(k)})$ [Bodlaender, Thilikos 1997]

Application: Compact routing scheme in k-chordal graphs additive stretch: $O(k \log \Delta)$, Routing Tables: $O(k \log n)$ bits.

Progress on Meyniel Conjecture

Meyniel Conjecture [85]: For any *n*-node connected graph G, $cn(G) = O(\sqrt{n})$

	cn	
dominating set $\leq k$	$\leq k$	[folklore]
$treewidth \leq t$	$\leq t/2 + 1$	[Joret, Kaminski, Theis 09]
chordality $\leq k$	< <i>k</i>	[Kosowski,Li,N.,Suchan 12]
$genus \leq g$	$\leq \lfloor \frac{3g}{2} \rfloor + 3$	(conjecture $\leq g+3$) [Schröder, 01]
H-minor free	$ \leq \tilde{E}(H) $	[Andreae, 86]
$degeneracy \leq d$	$\leq d$	[Lu,Peng 12]
diameter 2	$O(\sqrt{n})$	_
bipartite diameter 3	$O(\sqrt{n})$	_
Erdös-Réyni graphs	$O(\sqrt{n})$	[Bollobas <i>et al.</i> 08] [Luczak, Pralat 10]
Power law	$O(\sqrt{n})$	(big component?) [Bonato,Pralat,Wang 07]

A long story not finished yet...

•
$$cn(G) = O(\frac{n}{\log \log n})$$

[Frankl 1987]

•
$$cn(G) = O(\frac{n}{\log n})$$

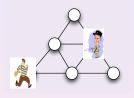

[Chiniforooshan 2008]

•
$$cn(G) = O(\frac{n}{2(1-o(1))\sqrt{\log n}})$$

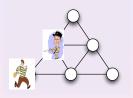

[Scott, Sudakov 11, Lu,Peng 12]

note that $\frac{n}{2^{(1-o(1))\sqrt{\log n}}} \geq n^{1-\epsilon}$ for any $\epsilon > 0$

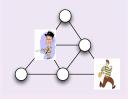

New variant with speed: Players may move along several edges per turn $cn_{s',s}(G)$: min # of Cops with speed s' to capture Robber with speed s, $s \ge s'$.

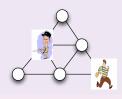

New variant with speed: Players may move along several edges per turn $cn_{s',s}(G)$: min # of Cops with speed s' to capture Robber with speed s, $s \ge s'$.

New variant with speed: Players may move along several edges per turn $cn_{s',s}(G)$: min # of Cops with speed s' to capture Robber with speed s, $s \ge s'$.

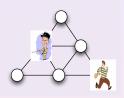

New variant with speed: Players may move along several edges per turn $cn_{s',s}(G)$: min # of Cops with speed s' to capture Robber with speed s, $s \ge s'$.

Meyniel Conjecture [Alon, Mehrabian'11] and general upper bound [Frieze,Krivelevich,Loh'12] extend to this variant

New variant with speed: Players may move along several edges per turn $cn_{s',s}(G)$: min # of Cops with speed s' to capture Robber with speed s, $s \ge s'$.

Meyniel Conjecture [Alon, Mehrabian'11] and general upper bound [Frieze,Krivelevich,Loh'12] extend to this variant

... but fundamental differences

(recall: planar graphs have $cn_{1,1} \leq 3$)

 $cn_{1,2}(G)$ unbounded in grids

[Fomin.Golovach.Kratochvil.N..Suchan TCS'10]

Open question: $\Omega(\sqrt{\log n}) \le c n_{1,2}(G) \le O(n)$ in $n \times n$ grid G

exact value?

G is $\mathbf{Cop\text{-}win} \Leftrightarrow 1$ Cop sufficient to capture Robber in G

Structural characterization of Cop-win graphs for any speed s and s^\prime

[Chalopin,Chepoi,N.,Vaxès SIDMA'11]

generalize seminal work of [Nowakowski, Winkler'83]

hyperbolicity δ of G: measures the "proximity" of the metric of G with a tree metric

New characterization and algorithm for hyperbolicity

- bounded hyperbolicity ⇒ one Cop can catch Robber almost twice faster
 [Chalopin, Chepoi, N., Vaxès SIDMA'11]
- one Cop can capture a faster Robber ⇒ bounded hyperbolicity
 [Chalopin,Chepoi,Papasoglu,Pecatte SIDMA'14]
- O(1)-approx. sub-cubic-time for hyperbolicity [Chalopin, Chepoi, Papasoglu, Pecatte SIDMA'14]
- $tree-length(G) \le \lfloor \frac{\ell}{2} \rfloor tw(G)$ for any graph G with max-isometric cycle ℓ $\Rightarrow O(\ell)$ -approx. for tw in bounded genus graphs [Coudert,Ducoffe,N. 14]

Conclusion / Open problems

Meyniel Conjecture [1985]: For any *n*-node connected graph G, $cn(G) = O(\sqrt{n})$

Conjecture [?]: For any *n*-node connected graph G with genus g, $cn(G) \leq g+3$

simpler(?) questions

- $cn(G) \le 3$ if G has genus ≤ 1 ?
- how many cops with speed 1 to capture a robber with speed 2 in a grid?
- when Cops can capture at distance?

[Bonato, Chiniforooshan, Pralat'10] [Chalopin, Chepoi, N., Vaxès'11]

Many other variants and questions...
