## FPT algorithmic techniques

Dániel Marx<br>Budapest University of Technology and Economics, Hungary

AGAPE'09 Spring School on Fixed Parameter and Exact Algorithms May 25-26, 2009, Lozari, Corsica (France)

## FPT algorithmic techniques

6 Significant advances in the past 20 years or so (especially in recent years).
6 Powerful toolbox for designing FPT algorithms:

## Goals

6 Demonstrate techniques that were successfully used in the analysis of parameterized problems.

6 There are two goals:
$\Delta$ Determine quickly if a problem is FPT.
$\Delta$ Design fast algorithms.
6 Warning: The results presented for particular problems are not necessarily the best known results or the most useful approaches for these problems.
(6) Conventions:
$\Delta$ Unless noted otherwise, $k$ is the parameter.
$\Delta O^{*}$ notation: $O^{*}(f(k))$ means $O\left(f(k) \cdot n^{c}\right)$ for some constant $c$.
$\Delta$ Citations are mostly omitted (only for classical results).
$\Delta$ We gloss over the difference between decision and search problems.

## Kernelization

## Kernelization

Definition: Kernelization is a polynomial-time transformation that maps an instance $(\boldsymbol{I}, \boldsymbol{k})$ to an instance ( $\left.I^{\prime}, k^{\prime}\right)$ such that

6 $(I, k)$ is a yes-instance if and only if $\left(I^{\prime}, k^{\prime}\right)$ is a yes-instance,
(6) $k^{\prime} \leq k$, and
© $\left|I^{\prime}\right| \leq f(k)$ for some function $f(k)$.

## Kernelization

Definition: Kernelization is a polynomial-time transformation that maps an instance ( $\boldsymbol{I}, \boldsymbol{k}$ ) to an instance ( $I^{\prime}, \boldsymbol{k}^{\prime}$ ) such that

6 $(I, k)$ is a yes-instance if and only if $\left(I^{\prime}, k^{\prime}\right)$ is a yes-instance,
(6) $k^{\prime} \leq k$, and
© $\left|I^{\prime}\right| \leq f(k)$ for some function $f(k)$.
Simple fact: If a problem has a kernelization algorithm, then it is FPT.
Proof: Solve the instance ( $I^{\prime}, k^{\prime}$ ) by brute force.

## Kernelization

Definition: Kernelization is a polynomial-time transformation that maps an instance ( $\boldsymbol{I}, \boldsymbol{k}$ ) to an instance ( $\boldsymbol{I}^{\prime}, \boldsymbol{k}^{\prime}$ ) such that

6 $(I, k)$ is a yes-instance if and only if $\left(I^{\prime}, k^{\prime}\right)$ is a yes-instance,
(6) $k^{\prime} \leq k$, and
© $\left|I^{\prime}\right| \leq f(k)$ for some function $f(k)$.
Simple fact: If a problem has a kernelization algorithm, then it is FPT.
Proof: Solve the instance ( $\boldsymbol{I}^{\prime}, \boldsymbol{k}^{\prime}$ ) by brute force.
Converse: Every FPT problem has a kernelization algorithm.
Proof: Suppose there is an $f(\boldsymbol{k}) \boldsymbol{n}^{c}$ algorithm for the problem.
6 If $f(k) \leq n$, then solve the instance in time $f(k) n^{c} \leq n^{c+1}$, and output a trivial yes- or no-instance.

6 If $n<f(k)$, then we are done: a kernel of size $f(k)$ is obtained.

## Kernelization for Vertex Cover

General strategy: We devise a list of reduction rules, and show that if none of the rules can be applied and the size of the instance is still larger than $f(\boldsymbol{k})$, then the answer is trivial.

Reduction rules for Vertex Cover instance ( $\boldsymbol{G}, \boldsymbol{k}$ ):
Rule 1: If $v$ is an isolated vertex $\Rightarrow(G \backslash v, k)$
Rule 2: If $d(v)>k \Rightarrow(G \backslash v, k-1)$
If neither Rule 1 nor Rule 2 can be applied:
(6) If $|\boldsymbol{V}(\boldsymbol{G})|>k(k+1) \Rightarrow$ There is no solution (every vertex should be the neighbor of at least one vertex of the cover).
© Otherwise, $|V(G)| \leq k(k+1)$ and we have a $k(k+1)$ vertex kernel.

## Kernelization for Vertex Cover

Let us add a third rule:
Rule 1: If $v$ is an isolated vertex $\Rightarrow(G \backslash v, k)$
Rule 2: If $d(v)>k \Rightarrow(G \backslash v, k-1)$
Rule 3: If $d(v)=1$, then we can assume that its neighbor $u$ is in the solution $\Rightarrow(G \backslash(u \cup v), k-1)$.

If none of the rules can be applied, then every vertex has degree at least 2.
$\Rightarrow|V(G)| \leq|E(G)|$
6. If $|\boldsymbol{E}(\boldsymbol{G})|>\boldsymbol{k}^{2} \Rightarrow$ There is no solution (each vertex of the solution can cover at most $k$ edges).
© Otherwise, $|V(G)| \leq|E(G)| \leq k^{2}$ and we have a $k^{2}$ vertex kernel.

## Covering Points with Lines

Task: Given a set $\boldsymbol{P}$ of $\boldsymbol{n}$ points in the plane and an integer $\boldsymbol{k}$, find $\boldsymbol{k}$ lines that cover all the points.

Note: We can assume that every line of the solution covers at least 2 points, thus there are at most $n^{2}$ candidate lines.

## Covering Points with Lines

Task: Given a set $\boldsymbol{P}$ of $\boldsymbol{n}$ points in the plane and an integer $\boldsymbol{k}$, find $\boldsymbol{k}$ lines that cover all the points.

Note: We can assume that every line of the solution covers at least 2 points, thus there are at most $n^{2}$ candidate lines.

## Covering Points with Lines

Task: Given a set $\boldsymbol{P}$ of $\boldsymbol{n}$ points in the plane and an integer $\boldsymbol{k}$, find $\boldsymbol{k}$ lines that cover all the points.

Note: We can assume that every line of the solution covers at least 2 points, thus there are at most $n^{2}$ candidate lines.

## Reduction Rule:

If a candidate line covers a set $S$ of more than $k$ points $\Rightarrow(P \backslash S, k-1)$.
If this rule cannot be applied and there are still more than $k^{2}$ points, then there is no solution $\Rightarrow$ Kernel with at most $\boldsymbol{k}^{2}$ points.

## Kernelization

(6) Kernelization can be thought of as a polynomial-time preprocessing before attacking the problem with whatever method we have. "It does no harm" to try kernelization.

6 Some kernelizations use lots of simple reduction rules and require a complicated analysis to bound the kernel size. . .

6 . . . while other kernelizations are based on surprising nice tricks (Next:
Crown Reduction and the Sunflower Lemma).
6 Possibility to prove lower bounds (S. Saurabh's lecture).

B윤융

## Crown Reduction

Definition: A crown decomposition is a partition $\boldsymbol{C} \cup \boldsymbol{H} \cup \boldsymbol{B}$ of the vertices such that
(6) $C$ is an independent set,

6 there is no edge between $C$ and $B$,
© there is a matching between $\boldsymbol{C}$ and $\boldsymbol{H}$ that covers $\boldsymbol{H}$.

## Crown Reduction

Definition: A crown decomposition is a partition $\boldsymbol{C} \cup \boldsymbol{H} \cup \boldsymbol{B}$ of the vertices such that
(6) $C$ is an independent set,

6 there is no edge between $C$ and $B$,
6 there is a matching between $\boldsymbol{C}$ and $\boldsymbol{H}$ that covers $\boldsymbol{H}$.

Crown rule for Vertex Cover:
The matching needs to be covered and we can assume that it is covered by $\boldsymbol{H}$ (makes no sense to use vertices of $C$ )
$\Rightarrow(G \backslash(H \cup C), k-|H|)$.

## Crown Reduction

Definition: A crown decomposition is a partition $\boldsymbol{C} \cup \boldsymbol{H} \cup \boldsymbol{B}$ of the vertices such that
(6) $C$ is an independent set,

6 there is no edge between $C$ and $B$,
6 there is a matching between $\boldsymbol{C}$ and $\boldsymbol{H}$ that covers $\boldsymbol{H}$.

Crown rule for Vertex Cover:
The matching needs to be covered and we can assume that it is covered by $\boldsymbol{H}$ (makes no sense to use vertices of $C$ )
$\Rightarrow(G \backslash(H \cup C), k-|H|)$.

## Crown Reduction

Key lemma:
Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either

6 find a matching of size $k+1$,
6 find a crown decomposition,
© or conclude that the graph has at most $3 k$ vertices.

## Crown Reduction

Key lemma:
Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either
© find a matching of size $k+1, \Rightarrow$ No solution!
6 find a crown decomposition, $\Rightarrow$ Reduce!
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.

$$
\Rightarrow 3 k \text { vertex kernel! }
$$

This gives a $3 k$ vertex kernel for Vertex Cover.

## Proof

Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either

6 find a matching of size $k+1$,
6 find a crown decomposition,
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.
For the proof, we need the classical Kőnig's Theorem.
$\tau(G)$ : size of the minimum vertex cover
$\nu(G)$ : size of the maximum matching (independent set of edges)
Theorem: [Kőnig, 1931] If $G$ is bipartite, then

$$
\tau(G)=\nu(G)
$$

## Proof

Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either

6 find a matching of size $k+1$,
6 find a crown decomposition,
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.
Proof: Find (greedily) a maximal matching; if its size is at least $k+1$, then we are done. The rest of the graph is an independent set $\boldsymbol{I}$.

## Proof

Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either
(6) find a matching of size $k+1$,

6 find a crown decomposition,
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.
Proof: Find (greedily) a maximal matching; if its size is at least $k+1$, then we are done. The rest of the graph is an independent set $\boldsymbol{I}$.

Find a maximum matching/minimum vertex cover in the bipartite graph between $\boldsymbol{X}$ and $\boldsymbol{I}$.

## Proof

Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either

6 find a matching of size $k+1$,
6 find a crown decomposition,
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.

## Proof:

Case 1: The minimum vertex cover contains at least one vertex of $\boldsymbol{X}$
$\Rightarrow$ There is a crown decomposition.

## Proof

Lemma: Given a graph $\boldsymbol{G}$ without isolated vertices and an integer $\boldsymbol{k}$, in polynomial time we can either

6 find a matching of size $k+1$,
6 find a crown decomposition,
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.

## Proof:

Case 1: The minimum vertex cover contains at least one vertex of $\boldsymbol{X}$
$\Rightarrow$ There is a crown decomposition.
Case 2: The minimum vertex cover contains only
 vertices of $I \Rightarrow$ It contains every vertex of $I$
$\Rightarrow$ There are at most $2 k+k$ vertices.

## Dual of Vertex Coloring

Parameteric dual of $\boldsymbol{k}$-Coloring. Also known as SAving $\boldsymbol{k}$ Colors.
Task: Given a graph $G$ and an integer $k$, find a vertex coloring with $|V(G)|-k$ colors.

Crown rule for Dual of Vertex Coloring:

## Dual of Vertex Coloring

Parameteric dual of $\boldsymbol{k}$-Coloring. Also known as SAving $\boldsymbol{k}$ Colors.
Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, find a vertex coloring with $|V(G)|-k$ colors.

Crown rule for Dual of Vertex Coloring:
Suppose there is a crown decomposition for the complement graph $\bar{G}$.

6 $C$ is a clique in $G$ : each vertex needs a distinct color.

6 Because of the matching, $\boldsymbol{H}$ can be colored using only these $|\boldsymbol{C}|$ colors.

6 These colors cannot be used for $\boldsymbol{B}$.
6 $(G \backslash(H \cup C), k-|H|)$

## Dual of Vertex Coloring

Parameteric dual of $\boldsymbol{k}$-Coloring. Also known as SAving $\boldsymbol{k}$ Colors.
Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, find a vertex coloring with $|V(G)|-k$ colors.

Crown rule for Dual of Vertex Coloring:
Suppose there is a crown decomposition for the complement graph $\bar{G}$.

6 $C$ is a clique in $G$ : each vertex needs a distinct color.

6 Because of the matching, $\boldsymbol{H}$ can be colored using only these $|\boldsymbol{C}|$ colors.
(6) These colors cannot be used for $\boldsymbol{B}$.

6 $(G \backslash(H \cup C), k-|H|)$

## Dual of Vertex Coloring

Parameteric dual of $\boldsymbol{k}$-Coloring. Also known as SAving $\boldsymbol{k}$ Colors.
Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, find a vertex coloring with $|V(G)|-k$ colors.

Crown rule for Dual of Vertex Coloring:
Suppose there is a crown decomposition for the complement graph $\bar{G}$.

6 $C$ is a clique in $G$ : each vertex needs a distinct color.

6 Because of the matching, $\boldsymbol{H}$ can be colored using only these $|\boldsymbol{C}|$ colors.
(6) These colors cannot be used for $\boldsymbol{B}$.

6 $(G \backslash(H \cup C), k-|H|)$

## Crown Reduction for Dual of Vertex Coloring

Use the key lemma for the complement $\bar{G}$ of $G$ :
Lemma: Given a graph $G$ without isolated vertices and an integer $k$, in polynomial time we can either

6 find a matching of size $k+1, \Rightarrow$ YES: we can save $k$ colors!
© find a crown decomposition, $\Rightarrow$ Reduce!
6 or conclude that the graph has at most $3 \boldsymbol{k}$ vertices.
$\Rightarrow 3 k$ vertex kernel!

This gives a 3k vertex kernel for Dual of Vertex Coloring.

## Sunflower Lemma

## Sunflower lemma

Definition: Sets $\boldsymbol{S}_{\mathbf{1}}, \boldsymbol{S}_{2}, \ldots, \boldsymbol{S}_{\boldsymbol{k}}$ form a sunflower if the sets $\boldsymbol{S}_{\boldsymbol{i}} \backslash\left(\boldsymbol{S}_{1} \cap \boldsymbol{S}_{\mathbf{2}} \cap \cdots \cap \boldsymbol{S}_{\boldsymbol{k}}\right)$ are disjoint.

Lemma: [Erdős and Rado, 1960] If the size of a set system is greater than $(p-1)^{d} \cdot d$ ! and it contains only sets of size at most $d$, then the system contains a sunflower with $p$ petals. Furthermore, in this case such a sunflower can be found in polynomial time.

## Sunflowers and d-Hitting Set

$\boldsymbol{d}$-Hitting Set: Given a collection $\mathcal{S}$ of sets of size at most $\boldsymbol{d}$ and an integer $\boldsymbol{k}$, find a set $\boldsymbol{S}$ of $\boldsymbol{k}$ elements that intersects every set of $\mathcal{S}$.

Reduction Rule: If $k+1$ sets form a sunflower, then remove these sets from $\mathcal{S}$ and add the center $C$ to $\mathcal{S}$ ( $S$ does not hit one of the petals, thus it has to hit the center).

If the rule cannot be applied, then there are at most $O\left(k^{d}\right)$ sets.

## Sunflowers and d-Hitting Set

$\boldsymbol{d}$-Hitting Set: Given a collection $\mathcal{S}$ of sets of size at most $\boldsymbol{d}$ and an integer $\boldsymbol{k}$, find a set $\boldsymbol{S}$ of $\boldsymbol{k}$ elements that intersects every set of $\mathcal{S}$.

Reduction Rule (variant): Suppose more than $k+1$ sets form a sunflower.
6 If the sets are disjoint $\Rightarrow$ No solution.
6 Otherwise, keep only $k+1$ of the sets.
If the rule cannot be applied, then there are at most $O\left(k^{d}\right)$ sets.

## Graph Minors

Neil Robertson

Paul Seymour

## Graph Minors

6 Some consequences of the Graph Minors Theorem give a quick way of showing that certain problems are FPT.
© However, the function $f(\boldsymbol{k})$ in the resulting FPT algorithms can be HUGE, completely impractical.

6 History: motivation for FPT.
6 Parts and ingredients of the theory are useful for algorithm design.
6 New algorithmic results are still being developed.

## Graph Minors

Definition: Graph $\boldsymbol{H}$ is a minor $\boldsymbol{G}(\boldsymbol{H} \leq \boldsymbol{G})$ if $\boldsymbol{H}$ can be obtained from $\boldsymbol{G}$ by deleting edges, deleting vertices, and contracting edges.

Example: A triangle is a minor of a graph $G$ if and only if $G$ has a cycle (i.e., it is not a forest).

## Graph minors

Equivalent definition: Graph $\boldsymbol{H}$ is a minor of $\boldsymbol{G}$ if there is a mapping $\phi$ that maps each vertex of $\boldsymbol{H}$ to a connected subset of $\boldsymbol{G}$ such that
(6) $\phi(u)$ and $\phi(v)$ are disjoint if $u \neq v$, and
© if $\boldsymbol{u} \boldsymbol{v} \in \boldsymbol{E}(\boldsymbol{G})$, then there is an edge between $\phi(\boldsymbol{u})$ and $\phi(\boldsymbol{v})$.

## Minor closed properties

Definition: A set $\mathcal{G}$ of graphs is minor closed if whenever $\boldsymbol{G} \in \mathcal{G}$ and $\boldsymbol{H} \leq \boldsymbol{G}$, then $\boldsymbol{H} \in \mathcal{G}$ as well.

Examples of minor closed properties:
planar graphs
acyclic graphs (forests)
graphs having no cycle longer than $\boldsymbol{k}$
empty graphs
Examples of not minor closed properties:
complete graphs
regular graphs
bipartite graphs

## Forbidden minors

Let $\mathcal{G}$ be a minor closed set and let $\mathcal{F}$ be the set of "minimal bad graphs": $\boldsymbol{H} \in \mathcal{F}$ if $\boldsymbol{H} \notin \mathcal{G}$, but every proper minor of $\boldsymbol{H}$ is in $\mathcal{G}$.

Characterization by forbidden minors:

$$
G \in \mathcal{G} \Longleftrightarrow \forall \boldsymbol{H} \in \mathcal{F}, \boldsymbol{H} \not \subset G
$$

The set $\mathcal{F}$ is the obstruction set of property $\mathcal{G}$.

## Forbidden minors

Let $\mathcal{G}$ be a minor closed set and let $\mathcal{F}$ be the set of "minimal bad graphs": $\boldsymbol{H} \in \mathcal{F}$ if $\boldsymbol{H} \notin \mathcal{G}$, but every proper minor of $\boldsymbol{H}$ is in $\mathcal{G}$.

Characterization by forbidden minors:

$$
\boldsymbol{G} \in \mathcal{G} \Longleftrightarrow \forall \boldsymbol{H} \in \mathcal{F}, \boldsymbol{H} \not \subset \boldsymbol{G}
$$

The set $\mathcal{F}$ is the obstruction set of property $\mathcal{G}$.
Theorem: [Wagner] A graph is planar if and only if it does not have a $\boldsymbol{K}_{\mathbf{5}}$ or $\boldsymbol{K}_{\mathbf{3 , 3}}$ minor.

In other words: the obstruction set of planarity is $\mathcal{F}=\left\{\boldsymbol{K}_{5}, \boldsymbol{K}_{\mathbf{3 , 3}}\right\}$.
Does every minor closed property have such a finite characterization?

## Graph Minors Theorem

Theorem: [Robertson and Seymour] Every minor closed property $\mathcal{G}$ has a finite obstruction set.

Note: The proof is contained in the paper series "Graph Minors I-XX". Note: The size of the obstruction set can be astronomical even for simple properties.

## Graph Minors Theorem

Theorem: [Robertson and Seymour] Every minor closed property $\mathcal{G}$ has a finite obstruction set.

Note: The proof is contained in the paper series "Graph Minors I-XX". Note: The size of the obstruction set can be astronomical even for simple properties.

Theorem: [Robertson and Seymour] For every fixed graph $\boldsymbol{H}$, there is an $\boldsymbol{O}\left(\boldsymbol{n}^{3}\right)$ time algorithm for testing whether $\boldsymbol{H}$ is a minor of the given graph $\boldsymbol{G}$.

Corollary: For every minor closed property $\mathcal{G}$, there is an $O\left(n^{3}\right)$ time algorithm for testing whether a given graph $G$ is in $\mathcal{G}$.

## Applications

Planar Face Cover: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, find an embedding of planar graph $G$ such that there are $k$ faces that cover all the vertices.

## One line argument:

For every fixed $\boldsymbol{k}$, the class $\mathcal{G}_{k}$ of graphs of yes-instances is minor closed. $\Downarrow$
For every fixed $\boldsymbol{k}$, there is a $\boldsymbol{O}\left(\boldsymbol{n}^{\mathbf{3}}\right)$ time algorithm for Planar Face Cover.
Note: non-uniform FPT.

## Applications

$\boldsymbol{k}$-Leaf Spanning Tree: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, find a spanning tree with at least $\boldsymbol{k}$ leaves.

Technical modification: Is there such a spanning tree for at least one component of $G$ ?

## One line argument:

For every fixed $\boldsymbol{k}$, the class $\mathcal{G}_{k}$ of no-instances is minor closed.
$\Downarrow$
For every fixed $k, k$-Leaf Spanning Tree can be solved in time $O\left(n^{3}\right)$.

## $\mathcal{G}+\boldsymbol{k}$ vertices

Let $\mathcal{G}$ be a graph property, and let $\mathcal{G}+\boldsymbol{k} \boldsymbol{v}$ contain graph $\boldsymbol{G}$ if there is a set $S \subseteq V(G)$ of $k$ vertices such that $G \backslash S \in \mathcal{G}$.

Lemma: If $\mathcal{G}$ is minor closed, then $\mathcal{G}+\boldsymbol{k v}$ is minor closed for every fixed $\boldsymbol{k}$. $\Rightarrow$ Finding the smallest $k$ such that a given graph is in $\mathcal{G}+\boldsymbol{k v}$ is FPT.

## $\mathcal{G}+k$ vertices

Let $\mathcal{G}$ be a graph property, and let $\mathcal{G}+\boldsymbol{k v}$ contain graph $\boldsymbol{G}$ if there is a set $S \subseteq V(G)$ of $k$ vertices such that $G \backslash \boldsymbol{S} \in \mathcal{G}$.

Lemma: If $\mathcal{G}$ is minor closed, then $\mathcal{G}+\boldsymbol{k v}$ is minor closed for every fixed $\boldsymbol{k}$.
$\Rightarrow$ Finding the smallest $k$ such that a given graph is in $\mathcal{G}+\boldsymbol{k v}$ is FPT.
(6) If $\mathcal{G}=$ forests $\Rightarrow \mathcal{G}+\boldsymbol{k v}=$ graphs that can be made acyclic by the deletion of $k$ vertices $\Rightarrow$ FEEDBACK VERTEX SET is FPT.

6 If $\mathcal{G}=$ planar graphs $\Rightarrow \mathcal{G}+\boldsymbol{k} \boldsymbol{v}=$ graphs that can be made planar by the deletion of $\boldsymbol{k}$ vertices ( $\boldsymbol{k}$-apex graphs) $\Rightarrow \boldsymbol{k}$-APEX GRAPH is FPT.
(6) If $\mathcal{G}=$ empty graphs $\Rightarrow \mathcal{G}+\boldsymbol{k v}=$ graphs with vertex cover number at most $\boldsymbol{k} \Rightarrow$ Vertex Cover is FPT.

## Two types of problems

We have to solve some problems.

We have to find something nice hidden somewhere.

## Two types of problems

We have to solve some problems.

Typically minimization problems: Vertex Cover, Hitting Set, Dominating Set, covering/stabbing problems, graph modification problems, ...

Bounded search trees, iterative compression

We have to find something nice hidden somewhere.

Typically maximization problems: $\boldsymbol{k}$-PATH, DISJOINT Triangles, $\boldsymbol{k}$-Leaf Spanning Tree, ...

Color coding, matroids

## Forbidden subgraphs

## Forbidden subgraphs

General problem class: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, transform $\boldsymbol{G}$ with at most $k$ modifications (add/remove vertices/edges) into a graph having property $\mathcal{P}$.

## Example:

TRIANGLE DELETION: make the graph triangle-free by deleting at most $\boldsymbol{k}$ vertices.

Branching algorithm:
6 If the graph is triangle-free, then we are done.
6 If there is a triangle $\boldsymbol{v}_{\boldsymbol{1}} \boldsymbol{v}_{\boldsymbol{2}} \boldsymbol{v}_{\boldsymbol{3}}$, then at least one of $\boldsymbol{v}_{\boldsymbol{1}}, \boldsymbol{v}_{\boldsymbol{2}}, \boldsymbol{v}_{\boldsymbol{3}}$ has to be deleted $\Rightarrow$ We branch into 3 directions.

## Triangle deletion

Search tree:

The search tree has at most $3^{k}$ leaves and the work to be done is polynomial at each step $\Rightarrow O^{*}\left(3^{k}\right)$ time algorithm.

Note: If the answer is "NO", then the search tree has exactly $3^{k}$ leaves.

## Hereditary properties

Definition: A graph property $\mathcal{P}$ is hereditary if for every $G \in \mathcal{P}$ and induced subgraph $G^{\prime}$ of $G$, we have $G^{\prime} \in \mathcal{P}$ as well.

Examples: triangle-free, bipartite, interval graph, planar
Observation: Every hereditary property $\mathcal{P}$ can be characterized by a (finite or infinite) set $\mathcal{F}$ of forbidden induced subgraphs:

$$
\boldsymbol{G} \in \mathcal{P} \Leftrightarrow \forall \boldsymbol{H} \in \mathcal{F}, \boldsymbol{H} \mathbb{Z}_{\text {ind }} \boldsymbol{G}
$$

## Hereditary properties

Definition: A graph property $\mathcal{P}$ is hereditary if for every $\boldsymbol{G} \in \mathcal{P}$ and induced subgraph $G^{\prime}$ of $G$, we have $G^{\prime} \in \mathcal{P}$ as well.

Examples: triangle-free, bipartite, interval graph, planar
Observation: Every hereditary property $\mathcal{P}$ can be characterized by a (finite or infinite) set $\mathcal{F}$ of forbidden induced subgraphs:

$$
G \in \mathcal{P} \Leftrightarrow \forall \boldsymbol{H} \in \mathcal{F}, \boldsymbol{H} \mathbb{Z}_{\text {ind }} \boldsymbol{G}
$$

Theorem: If $\mathcal{P}$ is hereditary and can be characterized by a finite set $\mathcal{F}$ of forbidden induced subgraphs, then the graph modification problems corresponding to $\mathcal{P}$ are FPT.

## Hereditary properties

Theorem: If $\mathcal{P}$ is hereditary and can be characterized by a finite set $\mathcal{F}$ of forbidden induced subgraphs, then the graph modification problems corresponding to $\mathcal{P}$ are FPT.

## Proof:

6 Suppose that every graph in $\mathcal{F}$ has at most $r$ vertices. Using brute force, we can find in time $\boldsymbol{O}\left(\boldsymbol{n}^{r}\right)$ a forbidden subgraph (if exists).
6. If a forbidden subgraph exists, then we have to delete one of the at most $r$ vertices or add/delete one of the at most $\binom{r}{2}$ edges $\Rightarrow$ Branching factor is a constant $\boldsymbol{c}$ depending on $\mathcal{F}$.

6 The search tree has at most $c^{k}$ leaves and the work to be done at each node is $O\left(n^{r}\right)$.

## Cluster Editing

Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add/remove at most $\boldsymbol{k}$ edges such that every component is a clique in the resulting graph.

## Cluster Editing

Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add/remove at most $\boldsymbol{k}$ edges such that every component is a clique in the resulting graph.

## Cluster Editing

Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add/remove at most $\boldsymbol{k}$ edges such that every component is a clique in the resulting graph.

## Cluster Editing

Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add/remove at most $\boldsymbol{k}$ edges such that every component is a clique in the resulting graph.

Property $\mathcal{P}$ : every component is a clique.
Forbidden induced subgraph:

$O^{*}\left(3^{k}\right)$ time algorithm.

## Chordal Completion

Definition: A graph is chordal if it does not contain an induced cycle of length greater than 3.

Chordal Completion: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add at most $\boldsymbol{k}$ edges to $G$ to make it a chordal graph.

## Chordal Completion

Definition: A graph is chordal if it does not contain an induced cycle of length greater than 3.

Chordal Completion: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add at most $\boldsymbol{k}$ edges to $G$ to make it a chordal graph.

The forbidden induced subgraphs are the cycles of length greater 3
$\Rightarrow$ Not a finite set!

## Chordal Completion

Definition: A graph is chordal if it does not contain an induced cycle of length greater than 3.

Chordal Completion: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add at most $\boldsymbol{k}$ edges to $G$ to make it a chordal graph.

The forbidden induced subgraphs are the cycles of length greater $\mathbf{3}$
$\Rightarrow$ Not a finite set!
Lemma: At least $\boldsymbol{k}-\mathbf{3}$ edges are needed to make a $\boldsymbol{k}$-cycle chordal.
Proof: By induction. $k=3$ is trivial.

## Chordal Completion

Definition: A graph is chordal if it does not contain an induced cycle of length greater than 3.

Chordal Completion: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, add at most $\boldsymbol{k}$ edges to $G$ to make it a chordal graph.

The forbidden induced subgraphs are the cycles of length greater 3
$\Rightarrow$ Not a finite set!
Lemma: At least $k-3$ edges are needed to make a $k$-cycle chordal.
Proof: By induction. $k=3$ is trivial.

$$
\begin{aligned}
& C_{x}: x-3 \text { edges } \\
& C_{k-x+2}: k-x-1 \text { edges } \\
& C_{k}:(x-3)+(k-x-1)+1= \\
& k-3 \text { edges }
\end{aligned}
$$

## Chordal Completion

Algorithm:
6 Find an induced cycle $C$ of length at least 4 (can be done in polynomial time).
(6) If no such cycle exists $\Rightarrow$ Done!
6. If $\boldsymbol{C}$ has more than $\boldsymbol{k}+\mathbf{3}$ vertices $\Rightarrow$ No solution!

6 Otherwise, one of the

$$
\binom{|C|}{2}-|C| \leq(k+3)(k+2) / 2-k=O\left(k^{2}\right)
$$

missing edges has to be added $\Rightarrow$ Branch!
Size of the search tree is $k^{O(k)}$.

## Chordal Completion - more efficiently

Definition: Triangulation of a cycle.

Lemma: Every chordal supergraph of a cycle $C$ contains a triangulation of the cycle $C$.

Lemma: The number of ways a cycle of length $k$ can be triangulated is exactly the $(k-2)$ th Catalan number

$$
C_{k-2}=\frac{1}{k-1}\binom{2(k-2)}{k-2} \leq 4^{k-3}
$$

## Chordal Completion - more efficiently

Algorithm:
6 Find an induced cycle $C$ of length at least 4 (can be done in polynomial time).
6. If no such cycle exists $\Rightarrow$ Done!
6. If $\boldsymbol{C}$ has more than $\boldsymbol{k}+\mathbf{3}$ vertices $\Rightarrow$ No solution!

6 Otherwise, one of the $\leq 4^{|C|-3}$ triangulations has to be in the solution $\Rightarrow$ Branch!

Claim: Search tree has at most $T_{k}=4^{k}$ leaves.
Proof: By induction. Number of leaves is at most

$$
T_{k} \leq 4^{|C|-3} \cdot T_{k-(|C|-3)} \leq 4^{|C|-3} \cdot 4^{k-(|C|-3)}=4^{k}
$$

## Iterative compression

## Iterative compression

© A surprising small, but very powerful trick.
6 Most useful for deletion problems: delete $k$ things to achieve some property.

6 Demonstration: Odd Cycle Transversal aka Bipartite Deletion aka Graph Bipartization: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, delete $\boldsymbol{k}$ vertices to make the graph bipartite.

6 Forbidden induced subgraphs: odd cycles. There is no bound on the size of odd cycles.

## Bipartite Deletion

Solution based on iterative compression:
6 Step 1:
Solve the annotated problem for bipartite graphs:
Given a bipartite graph G , two sets $B, W \subseteq V(G)$, and an integer
$\boldsymbol{k}$, find a set $S$ of at most $k$ vertices such that $G \backslash S$ has a 2-coloring where $B \backslash S$ is black and $W \backslash S$ is white.

## Bipartite Deletion

Solution based on iterative compression:
6 Step 1:
Solve the annotated problem for bipartite graphs:
Given a bipartite graph G , two sets $B, W \subseteq V(G)$, and an integer $\boldsymbol{k}$, find a set $S$ of at most $k$ vertices such that $G \backslash S$ has a 2-coloring where $B \backslash S$ is black and $W \backslash S$ is white.

6 Step 2:
Solve the compression problem for general graphs:
Given a graph $\boldsymbol{G}$, an integer $\boldsymbol{k}$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $k$ vertices such that $G \backslash S$ is bipartite.

## Bipartite Deletion

Solution based on iterative compression:
6 Step 1:
Solve the annotated problem for bipartite graphs:
Given a bipartite graph G , two sets $B, \boldsymbol{W} \subseteq V(G)$, and an integer $\boldsymbol{k}$, find a set $S$ of at most $\boldsymbol{k}$ vertices such that $G \backslash \boldsymbol{S}$ has a 2-coloring where $B \backslash S$ is black and $W \backslash S$ is white.
(6) Step 2:

Solve the compression problem for general graphs:
Given a graph $\boldsymbol{G}$, an integer $\boldsymbol{k}$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $k$ vertices such that $G \backslash S$ is bipartite.
(6) Step 3:

Apply the magic of iterative compression. . .

## Step 1: The annotated problem

Given a bipartite graph G , two sets $B, \boldsymbol{W} \subseteq \boldsymbol{V}(\boldsymbol{G})$, and an integer $\boldsymbol{k}$, find a set $S$ of at most $k$ vertices such that $G \backslash S$ has a 2-coloring where $B \backslash \boldsymbol{S}$ is black and $\boldsymbol{W} \backslash \boldsymbol{S}$ is white.

## Step 1: The annotated problem

Given a bipartite graph G , two sets $B, \boldsymbol{W} \subseteq \boldsymbol{V}(\boldsymbol{G})$, and an integer $\boldsymbol{k}$, find a set $S$ of at most $k$ vertices such that $G \backslash S$ has a 2-coloring where $B \backslash \boldsymbol{S}$ is black and $\boldsymbol{W} \backslash \boldsymbol{S}$ is white.

Find an arbitrary 2-coloring ( $\boldsymbol{B}_{\mathbf{0}}, \boldsymbol{W}_{\mathbf{0}}$ ) of $\boldsymbol{G}$.

## Step 1: The annotated problem

Given a bipartite graph G , two sets $B, \boldsymbol{W} \subseteq \boldsymbol{V}(\boldsymbol{G})$, and an integer $\boldsymbol{k}$, find a set $S$ of at most $k$ vertices such that $G \backslash S$ has a 2-coloring where $B \backslash \boldsymbol{S}$ is black and $\boldsymbol{W} \backslash \boldsymbol{S}$ is white.

Find an arbitrary 2-coloring $\left(B_{0}, W_{0}\right)$ of $G$.
$C:=\left(\boldsymbol{B}_{\mathbf{0}} \cap \boldsymbol{W}\right) \cup\left(\boldsymbol{W}_{\mathbf{0}} \cap \boldsymbol{B}\right)$ should change color, while $\boldsymbol{R}:=\left(\boldsymbol{B}_{\mathbf{0}} \cap \boldsymbol{B}\right) \cup\left(\boldsymbol{W}_{\mathbf{0}} \cap \boldsymbol{W}\right)$ should remain the same color.

## Step 1: The annotated problem

Given a bipartite graph G , two sets $B, \boldsymbol{W} \subseteq \boldsymbol{V}(\boldsymbol{G})$, and an integer $\boldsymbol{k}$, find a set $S$ of at most $k$ vertices such that $G \backslash S$ has a 2-coloring where $B \backslash \boldsymbol{S}$ is black and $\boldsymbol{W} \backslash \boldsymbol{S}$ is white.

Find an arbitrary 2-coloring ( $\boldsymbol{B}_{\mathbf{0}}, \boldsymbol{W}_{\mathbf{0}}$ ) of $G$.
$\boldsymbol{C}:=\left(\boldsymbol{B}_{\mathbf{0}} \cap \boldsymbol{W}\right) \cup\left(\boldsymbol{W}_{\mathbf{0}} \cap \boldsymbol{B}\right)$ should change color, while
$\boldsymbol{R}:=\left(\boldsymbol{B}_{\mathbf{0}} \cap \boldsymbol{B}\right) \cup\left(\boldsymbol{W}_{\mathbf{0}} \cap \boldsymbol{W}\right)$ should remain the same color.
Lemma: $G \backslash S$ has the required 2-coloring if and only if $S$ separates $C$ and $R$, i.e., no component of $G \backslash S$ contains vertices from both $C \backslash S$ and $R \backslash S$.

## Step 1: The annotated problem

Lemma: $G \backslash S$ has the required 2-coloring if and only if $S$ separates $C$ and $R$, i.e., no component of $G \backslash S$ contains vertices from both $C \backslash S$ and $R \backslash S$.

## Proof:

$\Rightarrow$ In a 2-coloring of $G \backslash S$, each vertex either remained the same color or changed color. Adjacent vertices do the same, thus every component either changed or remained.
$\Leftarrow$ Flip the coloring of those components of $G \backslash S$ that contain vertices from $C \backslash S$. No vertex of $R$ is flipped.

Algorithm: Using max-flow min-cut techniques, we can check if there is a set $S$ that separates $C$ and $R$. It can be done in time $\boldsymbol{O}(\boldsymbol{k}|\boldsymbol{E}(\boldsymbol{G})|)$ using $\boldsymbol{k}$ iterations of the Ford-Fulkerson algorithm.

## Step 2: The compression problem

Given a graph $\boldsymbol{G}$, an integer $\boldsymbol{k}$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $\boldsymbol{k}$ vertices such that $G \backslash S$ is bipartite.

## Step 2: The compression problem

Given a graph $G$, an integer $k$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $k$ vertices such that $G \backslash S$ is bipartite.

Branch into $3^{k+1}$ cases: each vertex of $S^{\prime}$ is either black, white, or deleted. Trivial check: no edge between two black or two white vertices.

## Step 2: The compression problem

Given a graph $G$, an integer $k$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $k$ vertices such that $G \backslash S$ is bipartite.

Branch into $3^{k+1}$ cases: each vertex of $S^{\prime}$ is either black, white, or deleted. Trivial check: no edge between two black or two white vertices.
Neighbors of the black vertices in $S^{\prime}$ should be white and the neighbors of the white vertices in $S^{\prime}$ should be black.

## Step 2: The compression problem

Given a graph $G$, an integer $k$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $k$ vertices such that $G \backslash S$ is bipartite.

Branch into $3^{k+1}$ cases: each vertex of $S^{\prime}$ is either black, white, or deleted. Trivial check: no edge between two black or two white vertices.
Neighbors of the black vertices in $S^{\prime}$ should be white and the neighbors of the white vertices in $S^{\prime}$ should be black.

## Step 2: The compression problem

Given a graph $G$, an integer $k$, and a set $S^{\prime}$ of $k+1$ vertices such that $G \backslash S^{\prime}$ is bipartite, find a set $S$ of $\boldsymbol{k}$ vertices such that $G \backslash S$ is bipartite.

The vertices of $S^{\prime}$ can be disregarded. Thus we need to solve the annotated problem on the bipartite graph $G \backslash S^{\prime}$.

Running time: $O\left(3^{k} \cdot k|E(G)|\right)$ time.

## Step 3: Iterative compression

How do we get a solution of size $k+1$ ?

## Step 3: Iterative compression

How do we get a solution of size $k+1$ ?
We get it for free!

## Step 3: Iterative compression

How do we get a solution of size $k+1$ ?

## We get it for free!

Let $V(G)=\left\{v_{1}, \ldots, v_{n}\right\}$ and let $G_{i}$ be the graph induced by $\left\{v_{1}, \ldots, v_{i}\right\}$.
For every $\boldsymbol{i}$, we find a set $\boldsymbol{S}_{\boldsymbol{i}}$ of size $\boldsymbol{k}$ such that $\boldsymbol{G}_{\boldsymbol{i}} \backslash \boldsymbol{S}_{\boldsymbol{i}}$ is bipartite.

6 For $G_{k}$, the set $S_{k}=\left\{v_{1}, \ldots, v_{k}\right\}$ is a trivial solution.
6 If $S_{i-1}$ is known, then $S_{i-1} \cup\left\{v_{i}\right\}$ is a set of size $k+1$ whose deletion makes $G_{i}$ bipartite $\Rightarrow$ We can use the compression algorithm to find a suitable $S_{i}$ in time $O\left(\mathbf{3}^{k} \cdot \boldsymbol{k}\left|E\left(G_{i}\right)\right|\right)$.

## Step 3: Iterative Compression

Bipartite-Deletion $(\boldsymbol{G}, \boldsymbol{k})$

1. $S_{k}=\left\{v_{1}, \ldots, v_{k}\right\}$
2. for $i:=k+\mathbf{1}$ to $n$
3. Invariant: $\boldsymbol{G}_{i-1} \backslash \boldsymbol{S}_{i-1}$ is bipartite.
4. Call Compression $\left(G_{i}, S_{i-1} \cup\left\{v_{i}\right\}\right)$
5. If the answer is " NO " $\Rightarrow$ return " NO "
6. If the answer is a set $\boldsymbol{X} \Rightarrow \boldsymbol{S}_{\boldsymbol{i}}:=\boldsymbol{X}$
7. Return the set $\boldsymbol{S}_{\boldsymbol{n}}$

Running time: the compression algorithm is called $n$ times and everything else can be done in linear time
$\Rightarrow O\left(3^{k} \cdot k|V(G)| \cdot|E(G)|\right)$ time algorithm.

## Color coding

## Color coding

6 Works best when we need to ensure that a small number of "things" are disjoint.

6 We demonstrate it on two problems:
$\Delta$ Find an $s$ - $\boldsymbol{t}$ path of length exactly $\boldsymbol{k}$.
$\Delta$ Find $k$ vertex-disjoint triangles in a graph.
6 Randomized algorithm, but can be derandomized using a standard technique.

6 Very robust technique, we can use it as an "opening step" when investigating a new problem.

## $k$-PATH

Task: Given a graph $G$, an integer $\boldsymbol{k}$, two vertices $s, t$, find a simple $s$ - $\boldsymbol{t}$ path with exactly $k$ internal vertices.

Note: Finding such a walk can be done easily in polynomial time.
Note: The problem is clearly NP-hard, as it contains the $s$ - $t$ HAMILTONIAN Path problem.

The $\boldsymbol{k}$-PATH algorithm can be used to check if there is a cycle of length exactly $k$ in the graph.

## $k$-РATH

Assign colors from $[k]$ to vertices $V(G) \backslash\{s, t\}$ uniformly and independently at random.

## $k$-РATH

6 Assign colors from $[k]$ to vertices $V(G) \backslash\{s, t\}$ uniformly and independently at random.

## $k$-PATH

6 Assign colors from $[k]$ to vertices $V(G) \backslash\{s, t\}$ uniformly and independently at random.

6 Check if there is a colorful $s$ - $t$ path: a path where each color appears exactly once on the internal vertices; output "YES" or "NO".

## $k$-PATH

(6) Assign colors from $[k]$ to vertices $V(G) \backslash\{s, t\}$ uniformly and independently at random.

6 Check if there is a colorful $s$ - $t$ path: a path where each color appears exactly once on the internal vertices; output "YES" or "NO".
$\Delta$ If there is no $s-t \boldsymbol{k}$-path: no such colorful path exists $\Rightarrow$ "NO".
$\Delta$ If there is an $\boldsymbol{s}-\boldsymbol{t} \boldsymbol{k}$-path: the probability that such a path is colorful is

$$
\frac{k!}{k^{k}}>\frac{\left(\frac{k}{e}\right)^{k}}{k^{k}}=e^{-k}
$$

thus the algorithm outputs "YES" with at least that probability.

## Error probability

б If there is a $k$-path, the probability that the algorithm does not say "YES" after $e^{k}$ repetitions is at most

$$
\left(1-e^{-k}\right)^{e^{k}}<\left(e^{-e^{-k}}\right)^{e^{k}}=1 / e \approx 0.38
$$

6 Repeating the whole algorithm a constant number of times can make the error probability an arbitrary small constant.
(6) For example, by trying $100 \cdot e^{k}$ random colorings, the probability of a wrong answer is at most $1 / e^{100}$.

## Error probability

6 If there is a $k$-path, the probability that the algorithm does not say "YES" after $e^{k}$ repetitions is at most

$$
\left(1-e^{-k}\right)^{e^{k}}<\left(e^{-e^{-k}}\right)^{e^{k}}=1 / e \approx 0.38
$$

6 Repeating the whole algorithm a constant number of times can make the error probability an arbitrary small constant.

6 For example, by trying $100 \cdot e^{k}$ random colorings, the probability of a wrong answer is at most $1 / e^{100}$.

It remains to see how a colorful $\boldsymbol{s}$ - $\boldsymbol{t}$ path can be found.
Method 1: Trying all permutations.
Method 2: Dynamic programming.

## Method 1: Trying all permutations

The colors encountered on a colorful $\boldsymbol{s}$ - $\boldsymbol{t}$ path form a permutation $\boldsymbol{\pi}$ of $\{1,2, \ldots, k\}$ :

We try all possible $k$ ! permutations. For a fixed $\pi$, it is easy to check if there is a path with this order of colors.

## Method 1: Trying all permutations

We try all possible $k$ ! permutations. For a fixed $\pi$, it is easy to check if there is a path with this order of colors.

6 Edges connecting nonadjacent color classes are removed.
6 The remaining edges are directed.
6. All we need to check if there is a directed $s$ - $\boldsymbol{t}$ path.

6 Running time is $O(k!\cdot|\boldsymbol{E}(G)|)$.

## Method 1: Trying all permutations

We try all possible $k$ ! permutations. For a fixed $\pi$, it is easy to check if there is a path with this order of colors.

© Edges connecting nonadjacent color classes are removed.
© The remaining edges are directed.
6 All we need to check if there is a directed $s-t$ path.
6 Running time is $O(k!\cdot|E(G)|)$.

## Method 1: Trying all permutations

We try all possible $k$ ! permutations. For a fixed $\pi$, it is easy to check if there is a path with this order of colors.

© Edges connecting nonadjacent color classes are removed.
6 The remaining edges are directed.
6 All we need to check if there is a directed $s$ - $\boldsymbol{t}$ path.
6 Running time is $O(k!\cdot|E(G)|)$.

## Method 2: Dynamic Programming

We introduce $2^{k} \cdot|V(G)|$ Boolean variables:

$$
x(v, C)=\text { TRUE for some } v \in V(G) \text { and } C \subseteq[k]
$$

There is an $s-v$ path where each color in $C$ appears exactly once and no other color appears.

## Method 2: Dynamic Programming

We introduce $2^{k} \cdot|V(G)|$ Boolean variables:

$$
x(v, C)=\text { TRUE for some } v \in V(G) \text { and } C \subseteq[k]
$$

There is an $s-v$ path where each color in $C$ appears exactly once and no other color appears.

Clearly, $x(s, \emptyset)=$ TRUE. Recurrence for vertex $v$ with color $r$ :

$$
x(v, C)=\bigvee_{u v \in E(G)} x(u, C \backslash\{r\})
$$

## Method 2: Dynamic Programming

We introduce $2^{k} \cdot|V(G)|$ Boolean variables:

$$
x(v, C)=\text { TRUE for some } v \in V(G) \text { and } C \subseteq[k]
$$

There is an $s-v$ path where each color in $C$ appears exactly once and no other color appears.

Clearly, $x(s, \emptyset)=$ TRUE. Recurrence for vertex $v$ with color $r$ :

$$
x(v, C)=\bigvee_{u v \in E(G)} x(u, C \backslash\{r\})
$$

If we know every $x(v, C)$ with $|C|=i$, then we can determine every $x(v, C)$ with $|C|=i+1 \Rightarrow$ All the values can be determined in time $O\left(2^{k} \cdot|E(G)|\right)$.

There is a colorful $s$ - $\boldsymbol{t}$ path $\Leftrightarrow \boldsymbol{x}(\boldsymbol{v},[k])=$ TRUE for some neighbor of $t$.

## Derandomization

Using Method 2, we obtain a $O^{*}\left((2 e)^{k}\right)$ time algorithm with constant error probability. How to make it deterministic?

Definition: A family $\mathcal{H}$ of functions $[n] \rightarrow[k]$ is a $\boldsymbol{k}$-perfect family of hash functions if for every $S \subseteq[n]$ with $|S|=k$, there is a $h \in \mathcal{H}$ such that $h(x) \neq \boldsymbol{h}(\boldsymbol{y})$ for any $\boldsymbol{x}, \boldsymbol{y} \in S, x \neq y$.

## Derandomization

Using Method 2, we obtain a $\boldsymbol{O}^{*}\left((2 e)^{k}\right)$ time algorithm with constant error probability. How to make it deterministic?

Definition: A family $\mathcal{H}$ of functions $[n] \rightarrow[k]$ is a $\boldsymbol{k}$-perfect family of hash functions if for every $S \subseteq[n]$ with $|S|=k$, there is a $h \in \mathcal{H}$ such that $h(x) \neq \boldsymbol{h}(\boldsymbol{y})$ for any $x, y \in S, x \neq y$.

Instead of trying $O\left(e^{k}\right)$ random colorings, we go through a $k$-perfect family $\mathcal{H}$ of functions $V(G) \rightarrow[k]$. If there is a solution $\Rightarrow$ The internal vertices $S$ are colorful for at least one $h \in \mathcal{H} \Rightarrow$ Algorithm outputs "YES".

## Derandomization

Using Method 2, we obtain a $O^{*}\left((2 e)^{k}\right)$ time algorithm with constant error probability. How to make it deterministic?

Definition: A family $\mathcal{H}$ of functions $[n] \rightarrow[k]$ is a $\boldsymbol{k}$-perfect family of hash functions if for every $S \subseteq[n]$ with $|S|=k$, there is a $h \in \mathcal{H}$ such that $h(x) \neq \boldsymbol{h}(\boldsymbol{y})$ for any $x, y \in S, x \neq y$.

Instead of trying $O\left(e^{k}\right)$ random colorings, we go through a $k$-perfect family $\mathcal{H}$ of functions $V(G) \rightarrow[k]$. If there is a solution $\Rightarrow$ The internal vertices $S$ are colorful for at least one $h \in \mathcal{H} \Rightarrow$ Algorithm outputs "YES".

Theorem: There is a $k$-perfect family of functions $[n] \rightarrow[k]$ having size $2^{O(k)} \log n$.
$\Rightarrow$ There is a deterministic $2^{O(k)} \cdot n^{O(1)}$ time algorithm for the $k$-PATH problem.

## $k$-Disjoint TriAngles

Task: Given a graph $G$ and an integer $k$, find $k$ vertex disjoint triangles.
Step 1: Choose a random coloring $V(G) \rightarrow[3 k]$.

## $k$-Disjoint TriAngles

Task: Given a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$, find $\boldsymbol{k}$ vertex disjoint triangles.
Step 1: Choose a random coloring $V(G) \rightarrow[3 k]$.
Step 2: Check if there is a colorful solution, where the $3 k$ vertices of the $k$ triangles use distinct colors.
(6) Method 1: Try every permutation $\pi$ of $[3 k]$ and check if there are triangles with colors $(\pi(1), \pi(2), \pi(3)),(\pi(4), \pi(5), \pi(6)), \ldots$
(6) Method 2: Dynamic programming. For $C \subseteq[3 k]$ and $|C|=3 \boldsymbol{i}$, let $x(C)=$ TRUE if and only if there are $|C| / 3$ disjoint triangles using exactly the colors in $C$.

$$
x(C)=\bigvee_{\left\{c_{1}, c_{2}, c_{3}\right\} \subseteq C}\left(x\left(C \backslash\left\{c_{1}, c_{2}, c_{3}\right\}\right) \wedge \exists \triangle \text { with colors } c_{1}, c_{2}, c_{3}\right)
$$

## $k$-Disjoint TriAngles

Step 3: Colorful solution exists with probability at least $e^{-3 k}$, which is a lower bound on the probability of a correct answer.

Running time: constant error probability after $e^{3 k}$ repetitions $\Rightarrow$ running time is $O^{*}\left((2 e)^{3 k}\right)$ (using Method 2 ).

Derandomization: $\mathbf{3 k}$-perfect family of functions instead of random coloring. Running time is $2^{O(k)} \cdot n^{O(1)}$.

## Color coding

We have seen that color coding can be used to find paths, cycles of length $\boldsymbol{k}$, or a set of $k$ disjoint triangles.

What other structures can be found efficiently with this technique?
The key is treewidth:
Theorem: Given two graph $\boldsymbol{H}, \boldsymbol{G}$, it can be decided if $\boldsymbol{H}$ is a subgraph of $\boldsymbol{G}$ in time $2^{O(|V(H)|)} \cdot|V(G)|^{O(w)}$, where $w$ is the treewidth of $G$.

Thus if $\boldsymbol{H}$ belongs to a class of graphs with bounded treewidth, then the subgraph problem is FPT.

## Matroid Theory

## Matroid Theory

(6) Matroids: a classical subject of combinatorial optimization.

6 Matroids lurk behind matching, flow, spanning tree, and some linear algebra problems.

6 A general FPT result that can be used to show that some concrete problems are FPT.

## Matroids

Definition: A set system $\mathcal{M}$ over $\boldsymbol{E}$ is a matroid if
(1) $\emptyset \in \mathcal{M}$.
(2) If $\boldsymbol{X} \in \mathcal{M}$ and $\boldsymbol{Y} \subseteq \boldsymbol{X}$, then $\boldsymbol{Y} \in \mathcal{M}$.
(3) If $\boldsymbol{X}, \boldsymbol{Y} \in \mathcal{M}$ and $|\boldsymbol{X}|>|\boldsymbol{Y}|$, then $\exists e \in \boldsymbol{X} \backslash \boldsymbol{Y}$ such that $\boldsymbol{Y} \cup\{e\} \in \mathcal{M}$.

Example: $\mathcal{M}=\{\emptyset, 1,2,3,12,13\}$ is a matroid.
Example: $\mathcal{M}=\{\emptyset, 1,2,12,3\}$ is not a matroid.

If $\boldsymbol{X} \in \mathcal{M}$, then we say that $\boldsymbol{X}$ is independent in matroid $\mathcal{M}$.

## Transversal matroid

Fact: Let $\boldsymbol{G}(\boldsymbol{A}, \boldsymbol{B} ; \boldsymbol{E})$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a matroid.

(1) The empty set can be clearly covered.
(2) If $\boldsymbol{X}$ can be covered, then every subset $\boldsymbol{Y} \subseteq \boldsymbol{X}$ can be covered.

## Transversal matroid

Fact: Let $\boldsymbol{G}(\boldsymbol{A}, \boldsymbol{B} ; \boldsymbol{E})$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a matroid.

(1) The empty set can be clearly covered.
(2) If $\boldsymbol{X}$ can be covered, then every subset $\boldsymbol{Y} \subseteq \boldsymbol{X}$ can be covered.

## Transversal matroid

Fact: Let $\boldsymbol{G}(\boldsymbol{A}, \boldsymbol{B} ; \boldsymbol{E})$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a matroid.

(1) The empty set can be clearly covered.
(2) If $\boldsymbol{X}$ can be covered, then every subset $\boldsymbol{Y} \subseteq \boldsymbol{X}$ can be covered.
(3) Suppose $|X|>|\boldsymbol{Y}|$ and they are covered by matchings $M_{X}$ and $M_{Y}$, respectively. There is a component of $M_{X} \cup M_{Y}$ containing more red edges than blue edges. We can augment $M_{Y}$ along this path.

## Transversal matroid

Fact: Let $\boldsymbol{G}(\boldsymbol{A}, \boldsymbol{B} ; \boldsymbol{E})$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a matroid.

(1) The empty set can be clearly covered.
(2) If $\boldsymbol{X}$ can be covered, then every subset $\boldsymbol{Y} \subseteq \boldsymbol{X}$ can be covered.
(3) Suppose $|X|>|\boldsymbol{Y}|$ and they are covered by matchings $M_{X}$ and $M_{Y}$, respectively. There is a component of $M_{X} \cup M_{Y}$ containing more red edges than blue edges. We can augment $M_{Y}$ along this path.

## Transversal matroid

Fact: Let $\boldsymbol{G}(\boldsymbol{A}, \boldsymbol{B} ; \boldsymbol{E})$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a matroid.

(1) The empty set can be clearly covered.
(2) If $\boldsymbol{X}$ can be covered, then every subset $\boldsymbol{Y} \subseteq \boldsymbol{X}$ can be covered.
(3) Suppose $|X|>|\boldsymbol{Y}|$ and they are covered by matchings $M_{X}$ and $M_{Y}$, respectively. There is a component of $M_{X} \cup M_{Y}$ containing more red edges than blue edges. We can augment $M_{Y}$ along this path.

## Linear matroids

Fact: Let $\boldsymbol{A}$ be matrix and let $\boldsymbol{E}$ be the set of column vectors in $\boldsymbol{A}$. The subsets $\boldsymbol{E}^{\prime} \subseteq \boldsymbol{E}$ that are linearly independent form a matroid.

## Proof:

(1) and (2) are clear.
(3) If $|\boldsymbol{X}|>|\boldsymbol{Y}|$ and both of them are linearly independent, then $\boldsymbol{X}$ spans a subspace with larger dimension than $\boldsymbol{Y}$. Thus $\boldsymbol{X}$ contains a vector $\boldsymbol{v}$ not spanned by $\boldsymbol{Y} \Rightarrow \boldsymbol{Y} \cup\{v\}$ is linearly independent.

## Example:

$$
\left.\begin{array}{rlll}
a & b & c & d \\
1 & 0 & 2 & 3 \\
0 & 1 & 4 & 6
\end{array}\right) \Rightarrow \mathcal{M}=\{\emptyset, a, b, c, d, a b, a c, a d, b c, b d\}
$$

## Representation

6. If $\boldsymbol{\mathcal { M }}$ is the matroid of the columns of a matrix $\boldsymbol{A}$, then $\boldsymbol{A}$ is a representation of $\mathcal{M}$.
(6) If $\boldsymbol{A}$ is a matrix over a field $\mathbb{F}$, then $\mathcal{M}$ is representable over $\mathbb{F}$.
© If $\boldsymbol{\mathcal { M }}$ is representable over some field $\mathbb{F}$, then $\boldsymbol{\mathcal { M }}$ is linear.
6 There are non-linear matroids (i.e., they cannot be represented over any field).

## Transversal matroids are linear

Fact: Let $G(A, B ; E)$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a linear matroid.

## Transversal matroids are linear

Fact: Let $G(A, B ; E)$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a linear matroid.

## Transversal matroids are linear

Fact: Let $G(A, B ; E)$ be a bipartite graph. Those subsets of $\boldsymbol{A}$ that can be covered by a matching form a linear matroid.

Construct the bipartite adjacency matrix: if $a_{i}$ and $b_{j}$ are neighbors, then the $i$-th element of row $j$ is a random integer between 1 and $N$.

## Transversal matroids are linear

$\left(\begin{array}{ccccc}a_{1} & a_{2} & a_{3} & a_{4} & a_{5} \\ ? & 0 & 0 & 0 & 0 \\ ? & ? & 0 & 0 & 0 \\ 0 & ? & 0 & ? & 0 \\ ? & 0 & ? & ? & ? \\ 0 & 0 & 0 & ? & ?\end{array}\right)$

Construct the bipartite adjacency matrix: if $a_{i}$ and $b_{j}$ are neighbors, then the $i$-th element of row $j$ is a random integer between 1 and $N$.

Elements can be matched $\Rightarrow$ The determinant is nonzero with high probability (Schwartz-Zippel)

## FPT result

Main result: Let $\mathcal{M}$ be a linear matroid over $\boldsymbol{E}$, given by a representation $\boldsymbol{A}$. Let $\mathcal{S}$ be a collection of subsets of $\boldsymbol{E}$, each of size at most $\ell$. It can be decided in randomized time $f(k, \ell) \cdot n^{O(1)}$ whether $\mathcal{M}$ has an independent set that is the union of $k$ disjoint sets from $\mathcal{S}$.

Immediate application: $\boldsymbol{k}$-DISJOINT TRIANGLES is (randomized) FPT (let $\mathcal{S}$ be the set of all triangles in the graph).

Two not so obvious applications:
(6) Reliable Terminals

6 Assignment with Couples

## RELIABLE TERMINALS

Let $\boldsymbol{D}$ be a directed graph with a source vertex $s$ and a subset $\boldsymbol{T}$ of vertices.
Task: Select $k$ terminals $t_{1}, \ldots, t_{k} \in T$, and $\ell$ paths from $s$ to each $t_{i}$ such that these $k \cdot \ell$ paths are pairwise internally vertex disjoint.

## RELIABLE TERMINALS

Let $\boldsymbol{D}$ be a directed graph with a source vertex $s$ and a subset $\boldsymbol{T}$ of vertices.
Task: Select $k$ terminals $t_{1}, \ldots, t_{k} \in T$, and $\ell$ paths from $s$ to each $t_{i}$ such that these $k \cdot \ell$ paths are pairwise internally vertex disjoint.

## RELIABLE TERMINALS

Let $\boldsymbol{D}$ be a directed graph with a source vertex $s$ and a subset $\boldsymbol{T}$ of vertices.
Task: Select $k$ terminals $t_{1}, \ldots, t_{k} \in T$, and $\ell$ paths from $s$ to each $t_{i}$ such that these $k \cdot \ell$ paths are pairwise internally vertex disjoint.

Theorem: The problem can be solved in randomized time $f(k, \ell) \cdot n^{O(1)}$.

## Reliable terminals

A technical trick: replace each $t \in T$ with $\ell$ copies, and replace $s$ with a set $S$ of $k \cdot \ell$ copies.

## Reliable terminals

A technical trick: replace each $t \in T$ with $\ell$ copies, and replace $s$ with a set $S$ of $k \cdot \ell$ copies.

$$
k=2, \ell=3
$$

## RELIABLE TERMINALS

A technical trick: replace each $t \in T$ with $\ell$ copies, and replace $s$ with a set $S$ of $k \cdot \ell$ copies.

$$
k=2, \ell=3
$$

Now if a terminal $t$ is selected, then we should connect the $\ell$ copies of $t$ with $\ell$ different vertices of $S$.

## Reliable terminals

A technical trick: replace each $t \in T$ with $\ell$ copies, and replace $s$ with a set $S$ of $k \cdot \ell$ copies.

$$
k=2, \ell=3
$$

Now if a terminal $t$ is selected, then we should connect the $\ell$ copies of $t$ with $\ell$ different vertices of $S$.

Fact: [Perfect] Let $D$ be a directed graph and $S$ a subset of vertices. Those subsets $\boldsymbol{X}$ that can be reached from $\boldsymbol{S}$ by disjoint paths form a matroid.

## RELIABLE TERMINALS

Fact: [Perfect] Let $\boldsymbol{D}$ be a directed graph and $S$ a subset of vertices. Those subsets $\boldsymbol{X}$ that can be reached from $\boldsymbol{S}$ by disjoint paths form a matroid.

The problem is equivalent to finding $k$ blocks whose union is independent in this matroid $\Rightarrow$ We can solve it in randomized time $f(k, \ell) \cdot n^{O(1)}$.

The matroid is actually a transversal matroid of an appropriately defined bipartite graph, hence it is linear and we can construct a representation for it.

## Assignment with Couples

Task: Assign people to jobs (bipartite matching).
However, the set of people includes couples and the members of a couple cannot be assigned independently (say, they want to be in the same town).

Task: Given
6 a set of singles and a list of suitable jobs for each single,
6 a set of couples and a list of suitable pairs of jobs for each couple, assign a job to each single and a pair of jobs to each couple.

Theorem: ASSIGNMENT WITH COUPLES is randomized FPT parameterized by the number $k$ of couples.

## Assignment with Couples

$J$ : jobs, $S$ : singles, $C$ : couples
Let $\boldsymbol{X} \subseteq \boldsymbol{J}$ be in $\mathcal{M}$ if and only if $S$ has a matching with $\boldsymbol{J} \backslash \boldsymbol{X}$.
Lemma: $\mathcal{M}$ is matroid.
Let $\mathcal{M}^{\prime}$ be the matroid over $\boldsymbol{J} \cup \boldsymbol{C}$ such that $\boldsymbol{X} \in \mathcal{M}^{\prime} \Leftrightarrow \boldsymbol{X} \cap \boldsymbol{J} \in \mathcal{M}$.

## Assignment with Couples

$J$ : jobs, $S$ : singles, $C$ : couples
Let $\boldsymbol{X} \subseteq \boldsymbol{J}$ be in $\mathcal{M}$ if and only if $S$ has a matching with $\boldsymbol{J} \backslash \boldsymbol{X}$.
Lemma: $\mathcal{M}$ is matroid.
Let $\mathcal{M}^{\prime}$ be the matroid over $\boldsymbol{J} \cup \boldsymbol{C}$ such that $\boldsymbol{X} \in \mathcal{M}^{\prime} \Leftrightarrow \boldsymbol{X} \cap \boldsymbol{J} \in \mathcal{M}$.

For each couple $c \in C$ and suitable pair $\left\{\boldsymbol{j}_{1}, \boldsymbol{j}_{2}\right\}$, add triple $\left\{c, \boldsymbol{j}_{1}, \boldsymbol{j}_{2}\right\}$ to $\mathcal{S}$.
The $k$ couples and all the singles can be a assigned a job I
There are $\boldsymbol{k}$ disjoint triples in $\mathcal{S}$ whose union is independent in $\mathcal{M}^{\prime}$

## Assignment with Couples

$J$ : jobs, $S$ : singles, $C$ : couples
Let $\boldsymbol{X} \subseteq \boldsymbol{J}$ be in $\mathcal{M}$ if and only if $S$ has a matching with $\boldsymbol{J} \backslash \boldsymbol{X}$.
Lemma: $\mathcal{M}$ is matroid.
Let $\mathcal{M}^{\prime}$ be the matroid over $\boldsymbol{J} \cup \boldsymbol{C}$ such that $\boldsymbol{X} \in \mathcal{M}^{\prime} \Leftrightarrow \boldsymbol{X} \cap \boldsymbol{J} \in \mathcal{M}$.

For each couple $c \in C$ and suitable pair $\left\{\boldsymbol{j}_{1}, \boldsymbol{j}_{2}\right\}$, add triple $\left\{c, \boldsymbol{j}_{1}, \boldsymbol{j}_{2}\right\}$ to $\mathcal{S}$.
The $k$ couples and all the singles can be a assigned a job I
There are $\boldsymbol{k}$ disjoint triples in $\mathcal{S}$ whose union is independent in $\mathcal{M}^{\prime}$

## Cut problems

## Multiway Cut

Task: Given a graph $\boldsymbol{G}$, a set $\boldsymbol{T}$ of vertices, and an integer $\boldsymbol{k}$, find a set $\boldsymbol{S}$ of at most $k$ edges that separates $T$ (each component of $G \backslash S$ contains at most one vertex of $\boldsymbol{T}$ ).

Polynomial for $|\boldsymbol{T}|=2$, but NP-hard for $|\boldsymbol{T}|=3$.
Theorem: MULTIWAY CUT is FPT parameterized by $k$.

$\delta(R)$ : set of edges leaving $R$
$\lambda(X, Y)$ : minimum number of edges in an $(X, Y)$-separator

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
|\delta(A)|+|\delta(B)| \geq|\delta(A \cap B)|+|\delta(A \cup B)|
$$

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
|\delta(A)|+|\delta(B)| \geq|\delta(A \cap B)|+|\delta(A \cup B)|
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
\begin{array}{cccc}
|\delta(A)|+|\delta(B)| \geq|\delta(A \cap B)| & +|\delta(A \cup B)| \\
0 & 1 & 1 & 0
\end{array}
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
|\delta(A)|+|\delta(B)| \geq|\delta(A \cap B)|+|\delta(A \cup B)|
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
\begin{array}{cccc}
|\delta(A)|+|\delta(B)| \geq & \geq \delta(A \cap B) \mid & +|\delta(A \cup B)| \\
0 & 1 & 0 & 1
\end{array}
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
|\delta(A)|+|\delta(B)| \geq|\delta(A \cap B)|+|\delta(A \cup B)|
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
\begin{array}{cccc}
|\delta(A)|+|\delta(B)| \geq & |\delta(A \cap B)| & +|\delta(A \cup B)| \\
1 & 1 & 1 & 1
\end{array}
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Fact: The function $\delta$ is submodular: for arbitrary sets $A, B$,

$$
|\delta(A)|+|\delta(B)| \geq|\delta(A \cap B)|+|\delta(A \cup B)|
$$

Proof: Determine separately the contribution of the different types of edges.

## Submodularity

Consequence: There is a unique maximal $\boldsymbol{R}_{\max } \supseteq \boldsymbol{X}$ such that $\delta\left(\boldsymbol{R}_{\max }\right)$ is an $(\boldsymbol{X}, \boldsymbol{Y})$-separator of size $\boldsymbol{\lambda}(\boldsymbol{X}, \boldsymbol{Y})$.

Proof: Let $\boldsymbol{R}_{1}, \boldsymbol{R}_{2} \supseteq X$ be two sets such that $\delta\left(\boldsymbol{R}_{1}\right), \delta\left(\boldsymbol{R}_{\mathbf{2}}\right)$ are $(\boldsymbol{X}, \boldsymbol{Y})$-separators of size $\lambda:=\lambda(\boldsymbol{X}, \boldsymbol{Y})$.

Note: Analogous result holds for a unique minimal $\boldsymbol{R}_{\text {min }}$.

## Multiway Cut

Intuition: Consider a $t \in T$. A subset of the solution separates $t$ and $T \backslash\{t\}$.

## Multiway Cut

Intuition: Consider a $t \in T$. A subset of the solution separates $t$ and $T \backslash\{t\}$.

There are many such separators.

## Multiway Cut

Intuition: Consider a $t \in T$. A subset of the solution separates $t$ and $T \backslash\{t\}$.

There are many such separators.

## Multiway Cut

Intuition: Consider a $t \in T$. A subset of the solution separates $t$ and $T \backslash\{t\}$.

There are many such separators.
But a separator farther from $t$ and closer to $T \backslash\{t\}$ seems to be more useful.

## Important separators

Definition: An $(\boldsymbol{X}, \boldsymbol{Y})$-separator $\delta(\boldsymbol{R})(\boldsymbol{R} \supseteq \boldsymbol{X})$ is important if there is no $(X, Y)$-separator $\delta\left(R^{\prime}\right)$ with $R \subset R^{\prime}$ and $\left|\delta\left(R^{\prime}\right)\right| \leq|\delta(R)|$.

## Important separators

Definition: An $(\boldsymbol{X}, \boldsymbol{Y})$-separator $\delta(\boldsymbol{R})(\boldsymbol{R} \supseteq \boldsymbol{X})$ is important if there is no $(X, Y)$-separator $\delta\left(R^{\prime}\right)$ with $R \subset R^{\prime}$ and $\left|\delta\left(R^{\prime}\right)\right| \leq|\delta(R)|$.

## Important separators

Definition: An $(\boldsymbol{X}, \boldsymbol{Y})$-separator $\delta(\boldsymbol{R})(\boldsymbol{R} \supseteq \boldsymbol{X})$ is important if there is no $(X, Y)$-separator $\delta\left(R^{\prime}\right)$ with $R \subset R^{\prime}$ and $\left|\delta\left(R^{\prime}\right)\right| \leq|\delta(R)|$.

## Important separators

Definition: An $(\boldsymbol{X}, \boldsymbol{Y})$-separator $\delta(\boldsymbol{R})(\boldsymbol{R} \supseteq \boldsymbol{X})$ is important if there is no $(X, Y)$-separator $\delta\left(R^{\prime}\right)$ with $R \subset R^{\prime}$ and $\left|\delta\left(R^{\prime}\right)\right| \leq|\delta(R)|$.

## Important separators

Lemma: Let $t \in \boldsymbol{T}$. The Multiway Cut problem has a solution $S$ such that $S$ contains an important $(t, T \backslash\{t\})$-separator.

## Important separators

Lemma: Let $t \in \boldsymbol{T}$. The Multiway Cut problem has a solution $S$ such that $S$ contains an important $(t, T \backslash\{t\})$-separator.

Proof: Let $R$ be the vertices reachable from $t$ in $G \backslash S$.

## Important separators

Lemma: Let $t \in T$. The Multiway Cut problem has a solution $S$ such that $S$ contains an important $(t, T \backslash\{t\})$-separator.

Proof: Let $R$ be the vertices reachable from $t$ in $G \backslash S$.

If $\delta(R)$ is not important, then there is an important separator $\delta\left(R^{\prime}\right)$ that dominates it. Replace $S$ with $S^{\prime}:=(S \backslash \delta(R)) \cup \delta\left(R^{\prime}\right)\left(\left|S^{\prime}\right| \leq|S|\right)$.

## Important separators

Lemma: Let $t \in T$. The Multiway Cut problem has a solution $S$ such that $S$ contains an important $(t, T \backslash\{t\})$-separator.

Proof: Let $R$ be the vertices reachable from $t$ in $G \backslash S$.

If $\delta(R)$ is not important, then there is an important separator $\delta\left(R^{\prime}\right)$ that dominates it. Replace $S$ with $S^{\prime}:=(S \backslash \delta(R)) \cup \delta\left(R^{\prime}\right)\left(\left|S^{\prime}\right| \leq|S|\right)$.

A $\boldsymbol{u} \boldsymbol{v} \boldsymbol{v}$ path in $G \backslash \boldsymbol{S}^{\prime}$ implies a $\boldsymbol{u}-\boldsymbol{t}$ path, a contradiction.

## Important separators

Lemma: Let $t \in T$. The Multiway Cut problem has a solution $S$ such that $S$ contains an important $(t, T \backslash\{t\})$-separator.

Proof: Let $R$ be the vertices reachable from $t$ in $G \backslash S$.

If $\delta(R)$ is not important, then there is an important separator $\delta\left(R^{\prime}\right)$ that dominates it. Replace $S$ with $S^{\prime}:=(S \backslash \delta(R)) \cup \delta\left(R^{\prime}\right)\left(\left|S^{\prime}\right| \leq|S|\right)$.

A $\boldsymbol{u}-\boldsymbol{v}$ path in $G \backslash \boldsymbol{S}^{\prime}$ implies a $\boldsymbol{u}-\boldsymbol{t}$ path, a contradiction.

## Important separators

Lemma: There are at most $4^{\boldsymbol{k}}$ important $(\boldsymbol{X}, \boldsymbol{Y})$-separators of size at most $\boldsymbol{k}$.

## Example:

There are exactly $\mathbf{2}^{\boldsymbol{k} / \mathbf{2}}$ important $(\boldsymbol{X}, \boldsymbol{Y})$-separators of size at most $k$ in this graph.

## Important separators

Lemma: There are at most $4^{k}$ important $(\boldsymbol{X}, \boldsymbol{Y})$-separators of size at most $\boldsymbol{k}$.
Proof: First we show that $\boldsymbol{R}_{\max } \subseteq R$ for every important separator $\delta(\boldsymbol{R})$.

$$
\begin{gathered}
\left|\delta\left(R_{\max }\right)\right|+|\delta(R)| \geq\left|\delta\left(R_{\max } \cap R\right)\right|+\left|\delta\left(R_{\max } \cup R\right)\right| \\
\geq \lambda \\
\Downarrow \\
\left|\delta\left(R_{\max } \cup R\right)\right| \leq|\delta(R)| \\
\Downarrow
\end{gathered}
$$

If $R \neq \boldsymbol{R}_{\max } \cup \boldsymbol{R}$, then $\delta(\boldsymbol{R})$ is not important.
Thus the important $(\boldsymbol{X}, \boldsymbol{Y})$ - and $\left(\boldsymbol{R}_{\max }, \boldsymbol{Y}\right)$-separators are the same.

## Important separators

Lemma: There are at most $4^{k}$ important $(\boldsymbol{X}, \boldsymbol{Y})$-separators of size at most $\boldsymbol{k}$.

The edge $\boldsymbol{u v}$ leaving $\boldsymbol{R}_{\max }$ is either in the separator or not.
Branch 1: Edge $u v$ is in the separator. Delete $u v$ and set $k:=k-1$.
$\Rightarrow k$ decreases by one, $\boldsymbol{\lambda}$ decreases by at most 1 .
Branch 2: Edge $u v$ is not in the separator. Set $\boldsymbol{X}:=\boldsymbol{R}_{\max } \cup\{v\}$.
$\Rightarrow k$ remains the same, $\lambda$ increases by 1 .
The measure $2 k-\lambda$ decreases in each step.
$\Rightarrow$ Height of the search tree $\leq 2 k \Rightarrow \leq 2^{2 k}$ important separators.

## Algorithm for Multiway Cut

1. If every vertex of $\boldsymbol{T}$ is in a different component, then we are done.
2. Let $t \in T$ be a vertex with that is not separated from every $T \backslash\{t\}$.
3. Branch on a choice of an important $(\{t\}, T \backslash\{t\})$ separator $S$ of size at most $k$.
4. Set $G:=G \backslash S$ and $k:=k-|S|$.
5. Go to step 1.

Size of the search tree:
6 When searching for the important separator, $2 \boldsymbol{k}-\boldsymbol{\lambda}$ decreases at each branching.

6 When choosing the next $t, \lambda$ changes from 0 to positive, thus $2 k-\lambda$ does not increase.

Size of the search tree is at most $2^{2 k}$.

## Other separation problems

6 Some other variants:
$\triangle|T|$ as a parameter
$\triangle$ Multiterminal Cut: pairs $\left(s_{1}, t_{1}\right), \ldots,\left(s_{\ell}, t_{\ell}\right)$ have to be separated.
$\Delta$ Directed graphs
$\triangle$ Planar graphs
6 Useful for deletion-type problems such as Directed Feedback Vertex SET (via iterative compression).

6 Important separators: is it relevant for a given problem?

## Integer Linear Programming

## Integer Linear Programming

Linear Programming (LP): important tool in (continuous) combinatorial optimization. Sometimes very useful for discrete problems as well.

$$
\begin{aligned}
& \max c_{1} x_{1}+c_{2} x_{2}+c_{3} x_{3} \\
& \text { s.t. } \\
& x_{1}+5 x_{2}-x_{3} \leq \mathbf{8} \\
& 2 x_{1}-x_{3} \leq \mathbf{0} \\
& \mathbf{3} x_{2}+10 x_{3} \leq \mathbf{1 0} \\
& x_{1}, x_{2}, x_{3} \in \mathbb{R}
\end{aligned}
$$

Fact: It can be decided if there is a solution (feasibility) and an optimum solution can be found in polynomial time.

## Integer Linear Programming

Integer Linear Programming (ILP): Same as LP, but we require that every $\boldsymbol{x}_{\boldsymbol{i}}$ is integer.

Very powerful, able to model many NP-hard problems. (Of course, no polynomial-time algorithm is known.)

Theorem: ILP with $p$ variables can be solved in time $p^{O(p)} \cdot n^{O(1)}$.

## Closest String

Task: Given strings $s_{\mathbf{1}}, \ldots, s_{\boldsymbol{k}}$ of length $L$ over alphabet $\boldsymbol{\Sigma}$, and an integer $\boldsymbol{d}$, find a string $s$ (of length $L$ ) such that $d\left(s, s_{i}\right) \leq d$ for every $1 \leq i \leq k$.

Note: $d\left(s, s_{i}\right)$ is the Hamming distance.
Theorem: Closest String parameterized by $k$ is FPT. Theorem: CLOSEST STRING parameterized by $d$ is FPT. Theorem: Closest String parameterized by $L$ is FPT. Theorem: Closest String is NP-hard for $\boldsymbol{\Sigma}=\{\mathbf{0}, \mathbf{1}\}$.

## Closest String

Task: Given strings $s_{\mathbf{1}}, \ldots, s_{\boldsymbol{k}}$ of length $L$ over alphabet $\boldsymbol{\Sigma}$, and an integer $\boldsymbol{d}$, find a string $s$ (of length $L$ ) such that $d\left(s, s_{i}\right) \leq d$ for every $1 \leq i \leq k$.

Note: $d\left(s, s_{i}\right)$ is the Hamming distance.
Theorem: Closest String parameterized by $k$ is FPT. Theorem: CLOSEST STRING parameterized by $d$ is FPT. Theorem: Closest String parameterized by $L$ is FPT.
Theorem: Closest String is NP-hard for $\boldsymbol{\Sigma}=\{\mathbf{0}, \mathbf{1}\}$.

## Closest String

An instance with $k=5$ and a solution for $d=4$ :

| $s_{1}$ | CBDCCACBB |
| :--- | :--- |
| $s_{2}$ | ABDBCABDB |
| $s_{3}$ | CDDBACCBD |
| $s_{4}$ | DDABACCBD |
| $s_{5}$ | ACDBDDCBC |
|  | ADDBCACBD |

Each column can be described by a partition $\mathcal{P}$ of $[k]$.
The instance can be described by an integer $\boldsymbol{c}_{\mathcal{P}}$ for each partition $\mathcal{P}$ : the number of columns with this type.

## Closest String

An instance with $k=5$ and a solution for $d=4$ :

|  | ADDBCACBD |

Each column can be described by a partition $\mathcal{P}$ of $[k]$.
The instance can be described by an integer $\boldsymbol{c}_{\mathcal{P}}$ for each partition $\mathcal{P}$ : the number of columns with this type.

## Closest String

Each column can be described by a partition $\mathcal{P}$ of $[\boldsymbol{k}]$.
The instance can be described by an integer $\boldsymbol{c}_{\mathcal{P}}$ for each partition $\mathcal{P}$ : the number of columns with this type.

Describing a solution: If $C$ is a class of $\mathcal{P}$, let $\boldsymbol{x}_{\mathcal{P}, C}$ be the number of type $\mathcal{P}$ columns where the solution agrees with class $C$.

There is a solution iff the following ILP has a feasible solution:

$$
\begin{array}{rr}
\sum_{C \in \mathcal{P}} x_{\mathcal{P}, C} \leq c_{\mathcal{P}} & \forall \text { partition } \mathcal{P} \\
\sum_{i \notin C, C \in \mathcal{P}} x_{\mathcal{P}, C} \leq d & \forall 1 \leq i \leq k \\
x_{\mathcal{P}, C} \geq 0 & \forall \mathcal{P}, C
\end{array}
$$

Number of variables is $\leq \boldsymbol{B}(\boldsymbol{k}) \cdot \boldsymbol{k}$, where $\boldsymbol{B}(\boldsymbol{k})$ is the no. of partitions of $[\boldsymbol{k}]$ $\Rightarrow$ The ILP algorithm solves the problem in time $f(k) \cdot n^{O(1)}$.

## Steiner Tree

## Steiner Tree

Task: Given a graph $G$ with weighted edges and a set $S$ of $k$ vertices, find a tree $T$ of minimum weight that contains $S$.

Known to be NP-hard. For fixed $\boldsymbol{k}$, we can solve it in polynomial time: we can guess the Steiner points and the way they are connected.

Theorem: Steiner Tree is FPT parameterized by $k=|\boldsymbol{S}|$.

## Steiner Tree

Solution by dynamic programming. For $v \in V(G)$ and $X \subseteq S$, $c(v, X):=$ minimum cost of a Steiner tree of $\boldsymbol{X}$ that contains $\boldsymbol{v}$ $d(u, v):=$ distance of $u$ and $v$

## Recurrence relation:

$$
c(v, X)=\min _{\substack{u \in V(G) \\ \emptyset \subset X^{\prime} \subset X}} c\left(u, X^{\prime} \backslash u\right)+c\left(u,\left(X \backslash X^{\prime}\right) \backslash u\right)+d(u, v)
$$

## Steiner Tree

## Recurrence relation:

$$
c(v, X)=\min _{\substack{u \in V(G) \\ \emptyset \subset X^{\prime} \subset X}} c\left(u, X^{\prime} \backslash u\right)+c\left(u,\left(X \backslash X^{\prime}\right) \backslash u\right)+d(u, v)
$$

6 $\leq$ : A tree $\boldsymbol{T}_{1}$ realizing $\boldsymbol{c}\left(\boldsymbol{u}, \boldsymbol{X}^{\prime} \backslash \boldsymbol{u}\right)$, a tree $T_{2}$ realizing $c\left(u,\left(X \backslash X^{\prime}\right) \backslash u\right)$, and the path $u v$ gives a (superset of a) Steiner tree of $\boldsymbol{X}$ containing $\boldsymbol{v}$.

## Steiner Tree

## Recurrence relation:

$$
c(v, X)=\min _{\substack{u \in V(G) \\ \emptyset \subset X^{\prime} \subset X}} c\left(u, X^{\prime} \backslash u\right)+c\left(u,\left(X \backslash X^{\prime}\right) \backslash u\right)+d(u, v)
$$

6 $\geq$ : Suppose $T$ realizes $c(v, X)$, let $T^{\prime}$ be the minimum subtree containing $\boldsymbol{X}$. Let $u$ be a vertex of $T^{\prime}$ closest to $v$. If $|\boldsymbol{X}|>1$, then there is a component $C$ of $\boldsymbol{T} \backslash \boldsymbol{u}$ that contains a subset $\emptyset \subset X^{\prime} \subset X$ of terminals. Thus $\boldsymbol{T}$ is the disjoint union of a tree containing $\boldsymbol{X}^{\prime} \backslash \boldsymbol{u}$ and $\boldsymbol{u}$, a tree containing $\left(\boldsymbol{X} \backslash \boldsymbol{X}^{\prime}\right) \backslash \boldsymbol{u}$ and $\boldsymbol{u}$, and the path $\boldsymbol{u v}$.

## Steiner Tree

## Recurrence relation:

$$
c(v, X)=\min _{\substack{u \in V(G) \\ \emptyset \subset X^{\prime} \subset X}} c\left(u, X^{\prime} \backslash u\right)+c\left(u,(X \backslash u) \backslash X^{\prime}\right)+d(u, v)
$$

## Running time:

$2^{k}|\boldsymbol{V}(G)|$ variables $c(v, X)$, determine them in increasing order of $|\boldsymbol{X}|$.
Variable $c(v, X)$ can be determined by considering $2^{|X|}$ cases. Total number of cases to consider:

$$
\sum_{X \subseteq T} 2^{|X|}=\sum_{i=1}^{k}\binom{k}{i} 2^{i} \leq(1+2)^{k}=3^{k}
$$

Running time is $O^{*}\left(3^{k}\right)$.
Note: Running time can be reduced to $O^{*}\left(2^{k}\right)$ with clever techniques.

## Conclusions

(6) Many nice techniques invented so far - and probably many more to come.

6 A single technique might provide the key for several problems.
6 How to find new techniques? By attacking the open problems!
6 Needed: flexible, highly expressive problems. Solve other problems by reduction to these problems.
