# PDE in finance

Black-Scholes equation:

$$\frac{\partial V}{\partial t} + \frac{\sigma^2}{2} S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} - rV = 0$$

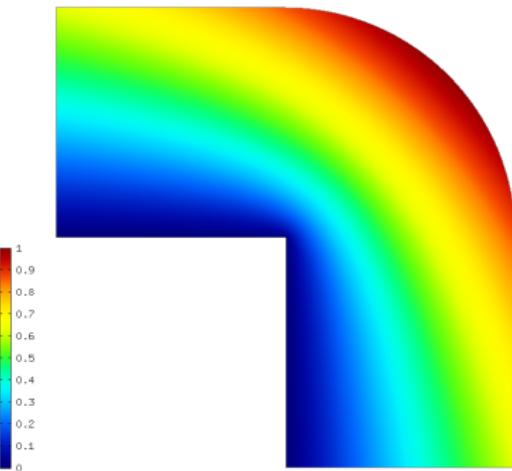

$S$  ... price of underlying stock,  
 $V$  ... option on  $S$  at time  $t$ ,  $V = V(S, t)$ .

# Our goal

Adaptive, higher-order computational methods that are PDE-independent.

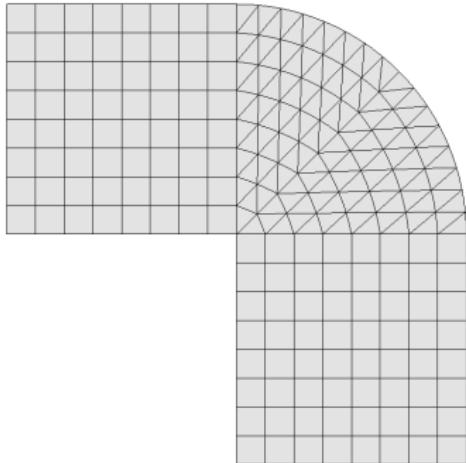

# Higher-order elements

( $\neq$  higher-order method)

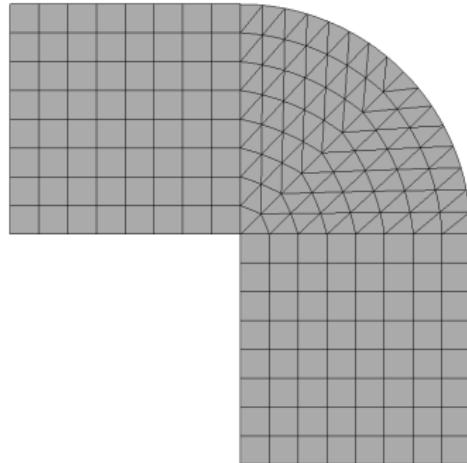

Example problem.

# Higher-order elements (example 1)

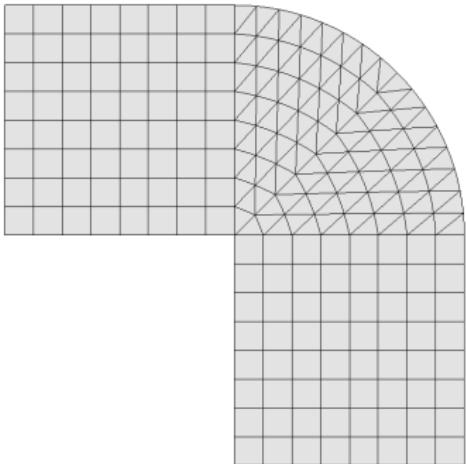

$err = 2.7 \%$

$err = 1.2 \%$

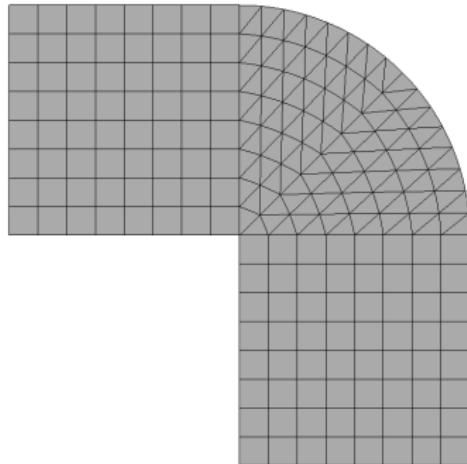

# Higher-order elements (example 1)

$err = 2.7 \%$

$ndof = 705$

$err \cdot ndof = 1903$

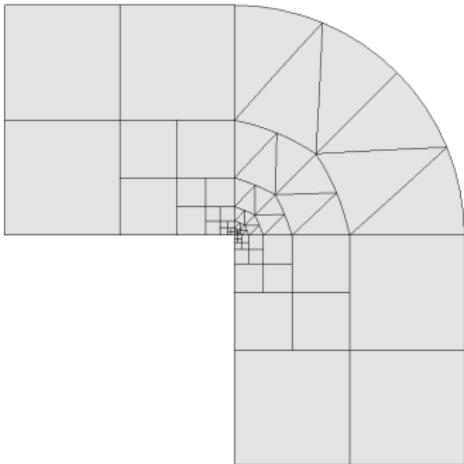

$err = 1.2 \%$

$ndof = 2900$

$err \cdot ndof = 3480$

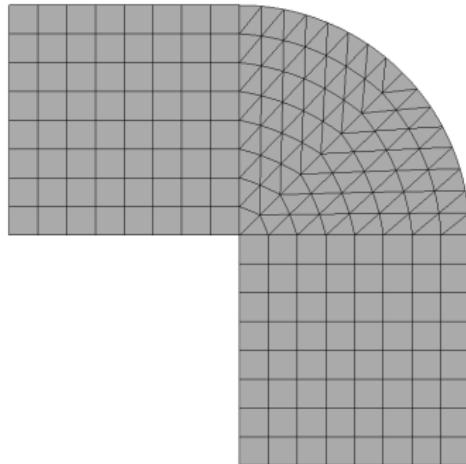

# Higher-order elements (example 2)

$$err = 0.92 \%$$

$$ndof = 173$$

$$err \cdot ndof = 159$$

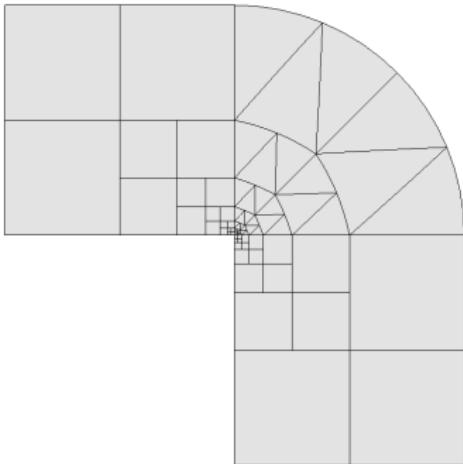

$$err = 1.2 \%$$

$$ndof = 2900$$

$$err \cdot ndof = 3480$$

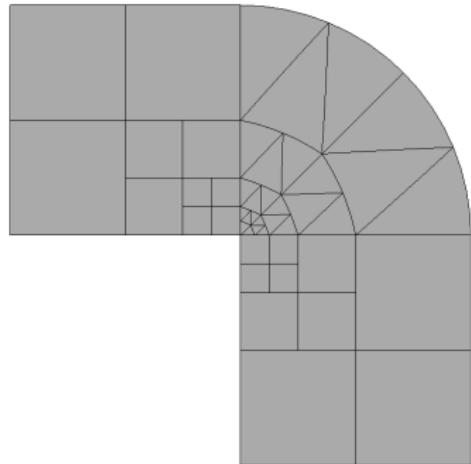

# Higher-order elements (example 3)

$$err = 0.92 \%$$

$$ndof = 173$$

$$err \cdot ndof = 159$$

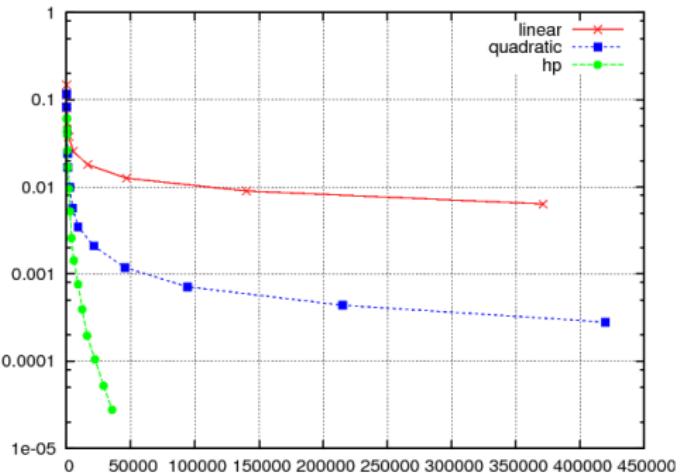

$$err = 1.02 \%$$

$$ndof = 457$$

$$err \cdot ndof = 466$$

# Higher-order elements

$err$	$p = 1$	$p = 2$	$p = 4$	$hp$
1 %	934	173	457	154
0.1 %	> 50000	1415	1185	622
0.01 %		18800	2317	1556

Higher-order method = higher-order elements + *good automatic adaptivity*

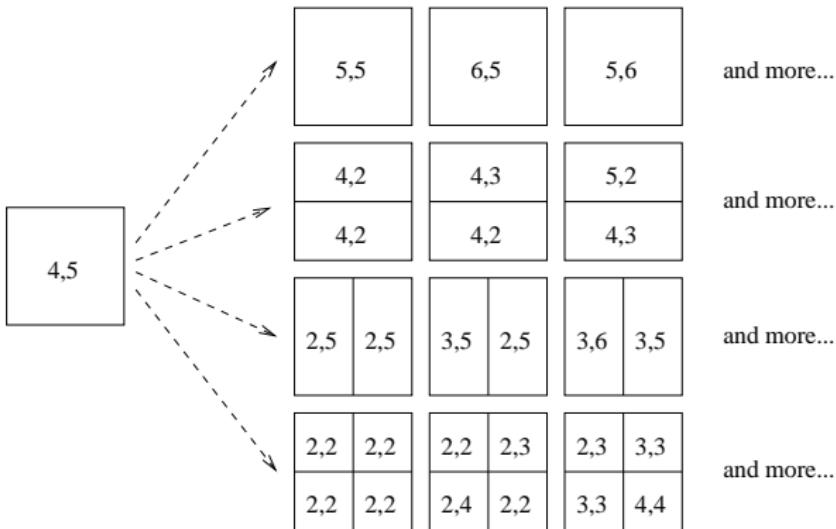

# Adaptive $hp$ -FEM

	Affine elements	$hp$ elements
DOF	259393	6331
Error	1.617%	1.521%
Iterations	228	60
CPU time	<b>34 min</b>	<b>11.58 sec</b>

	Whitney edge elements	$hp$ edge elements
DOF	2586540	4324
Error	0.6445%	0.6211%
CPU time	<b>21.2 min</b>	<b>2.49 sec</b>

# Adaptive $hp$ -FEM

To refine a single quad element:

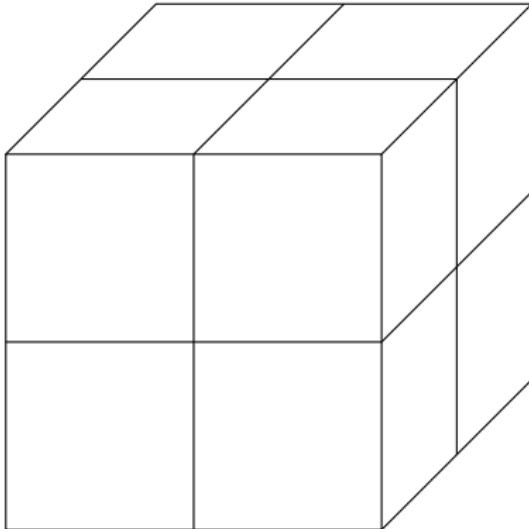

Variation of  $p, q$  by 2 in subelements  $\rightarrow$  approx. 7000 candidates.

Variation of  $p, q$  by 1 in subelements  $\rightarrow$  approx. 300 candidates.

# Adaptive $hp$ -FEM

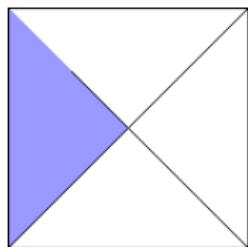

To refine a single brick element:

Variation of  $p, q$  by 2 in subelements → 282 billion candidates.  
Variation of  $p, q$  by 1 in subelements → 17 million candidates.

# Mesh regularity vs. performance

# Examples

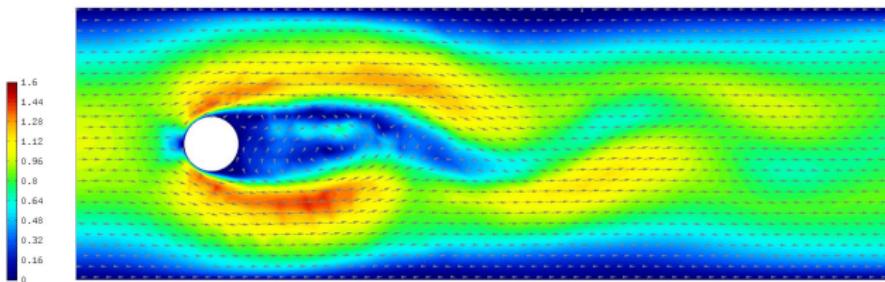

# Credibility of results

Navier-Stokes equations,  $\text{Re} = 200$

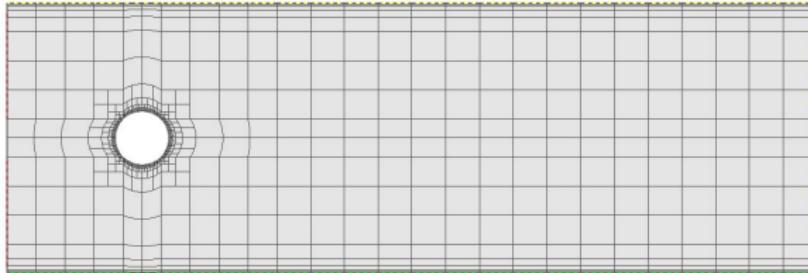

# Credibility of results

Navier-Stokes equations, Re = 200

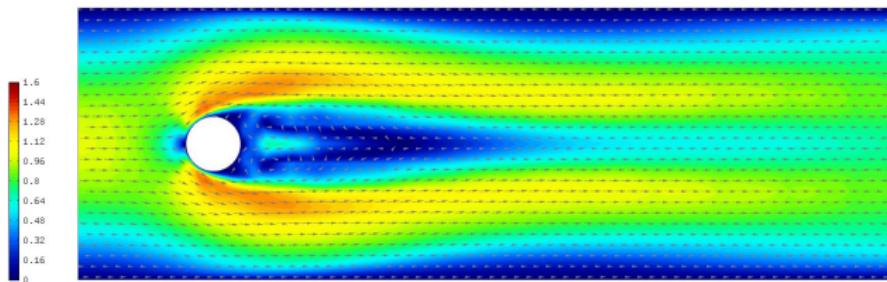

# Credibility of results

Re = 200, symmetric mesh

# Credibility of results

Re = 200, symmetric mesh

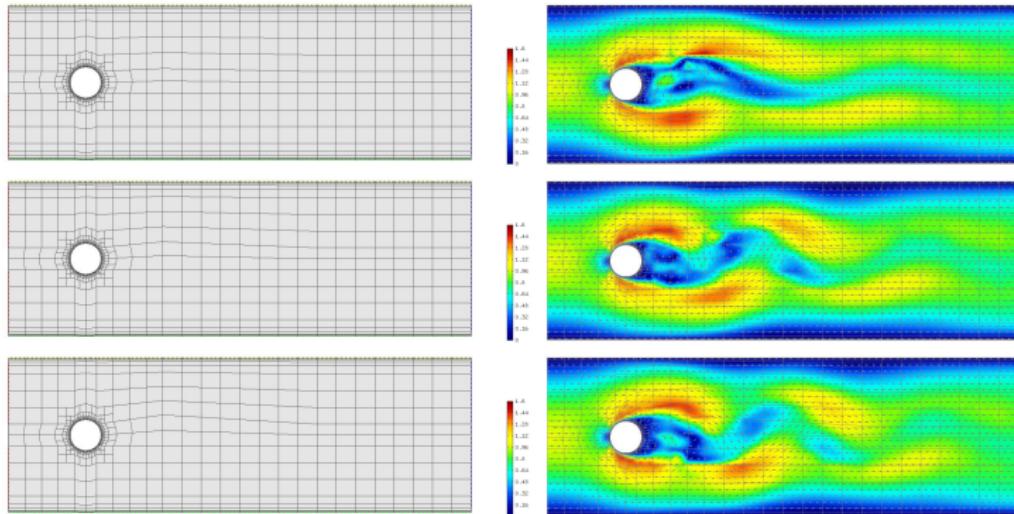

# Credibility of results

It is easy to show that the exact solution **has to be symmetric**.

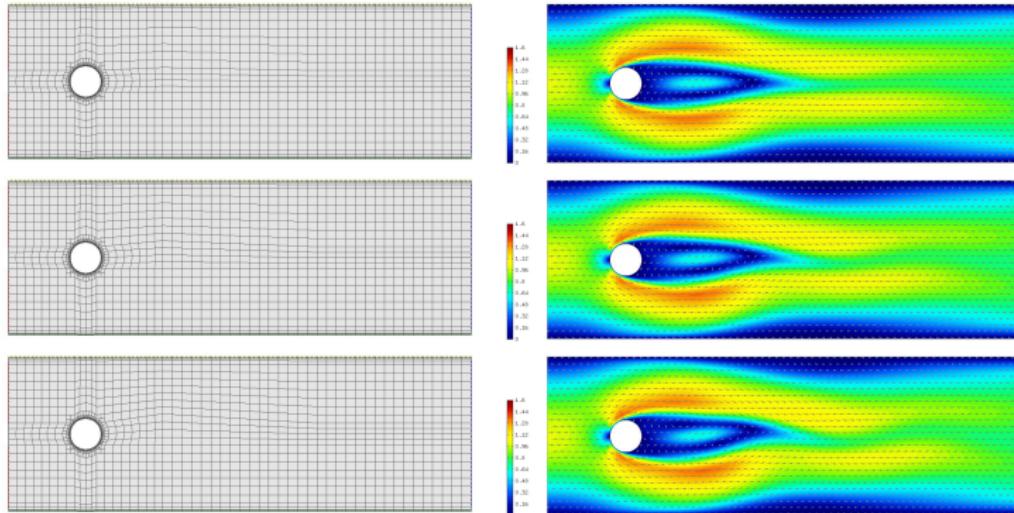

# Credibility of results

Re = 200, time = 20 s, small mesh perturbation

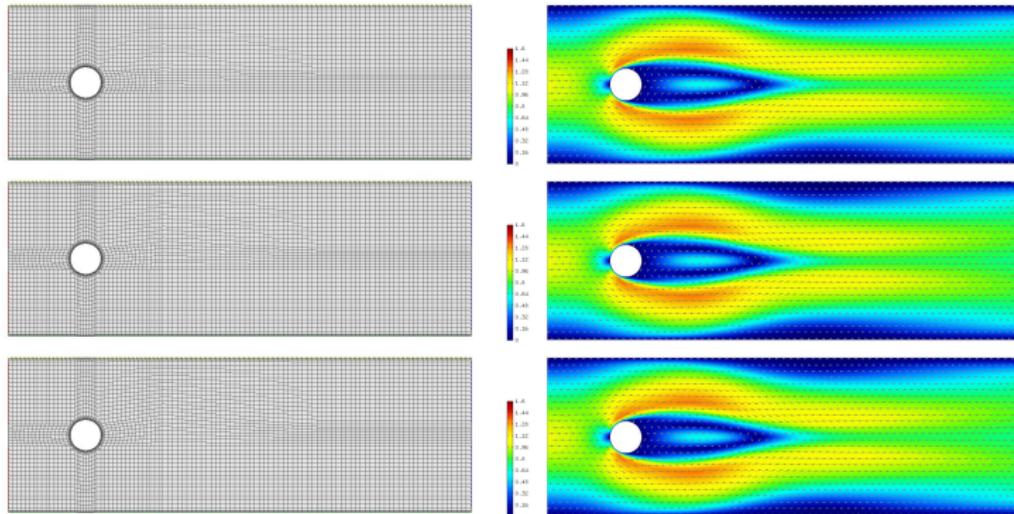

# Credibility of results

Re = 200, time = 20 s, small mesh perturbation, uniform refinement

# Credibility of results

Re = 200, time = 20 s, small mesh perturbation, 2x uniform refinement

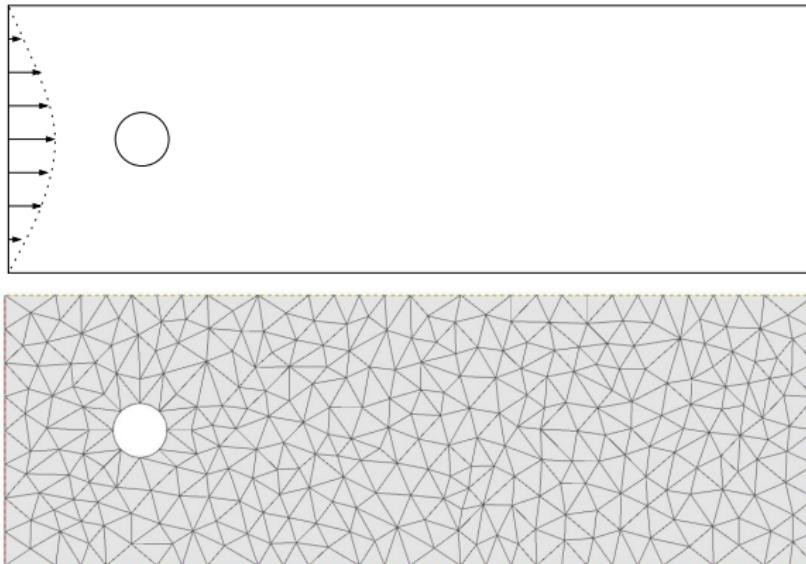

# Credibility of results

Uniform refinement helps, but usually **one cannot afford it.**

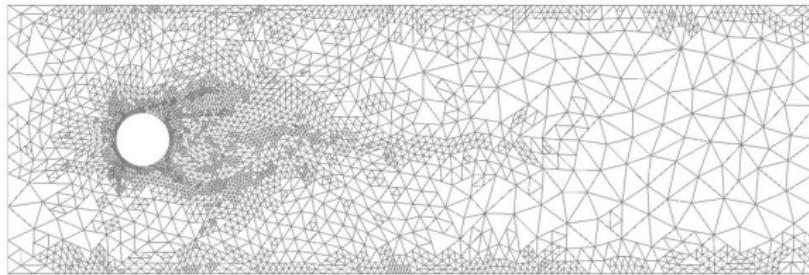

# Credibility of results

Re = 200, dynamical meshes

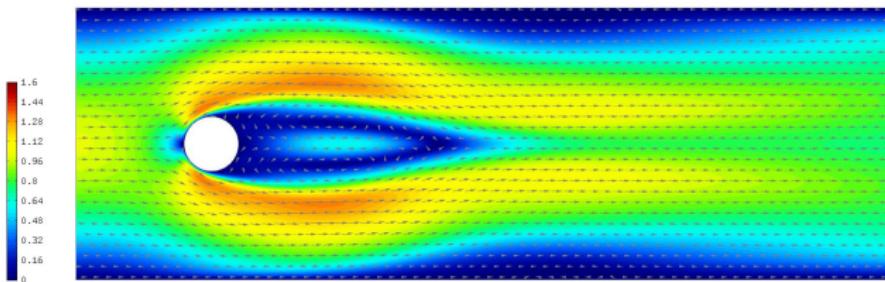

# Credibility of results

Re = 200, dynamical meshes

# Credibility of results

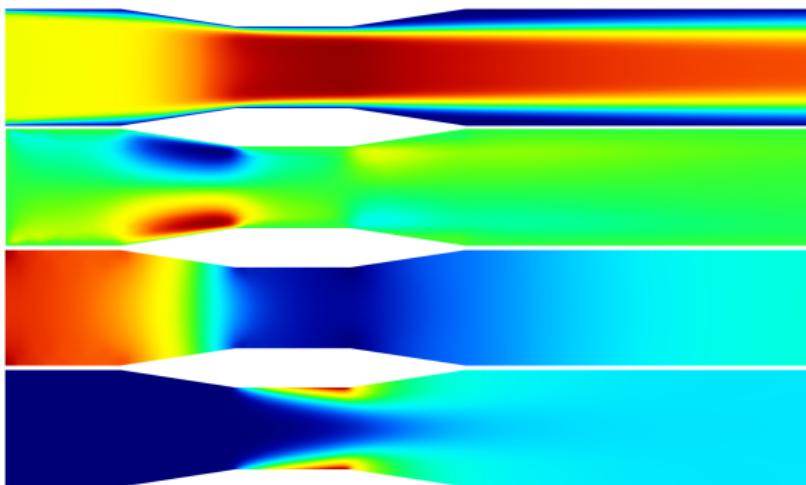

Re = 200, dynamical meshes

# Thermoelasticity (step 10)

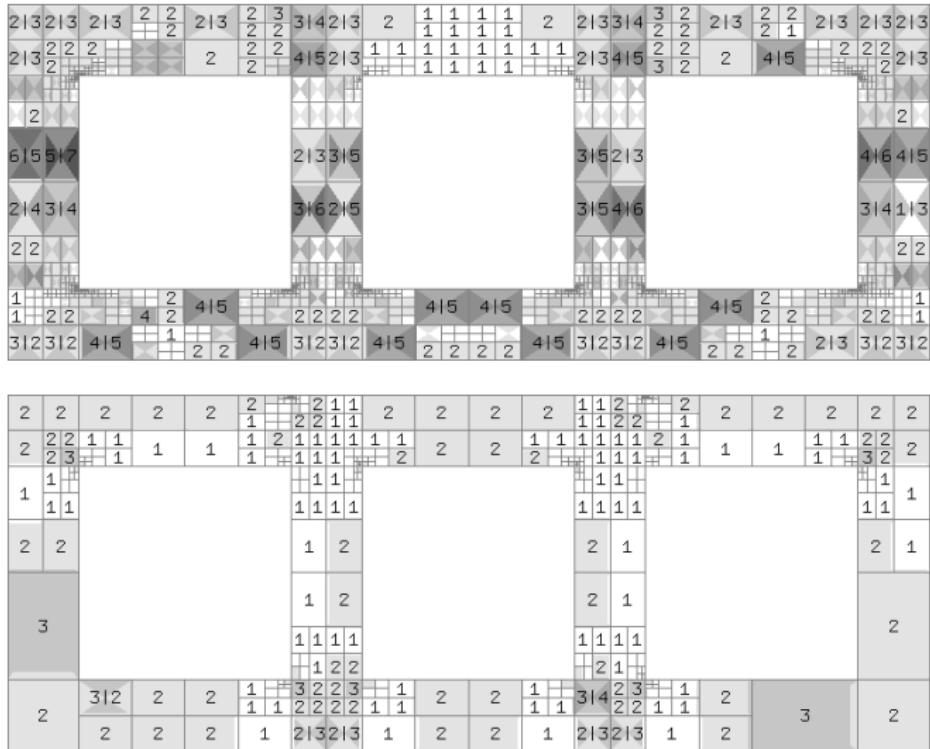

# Thermoelasticity (step 11)

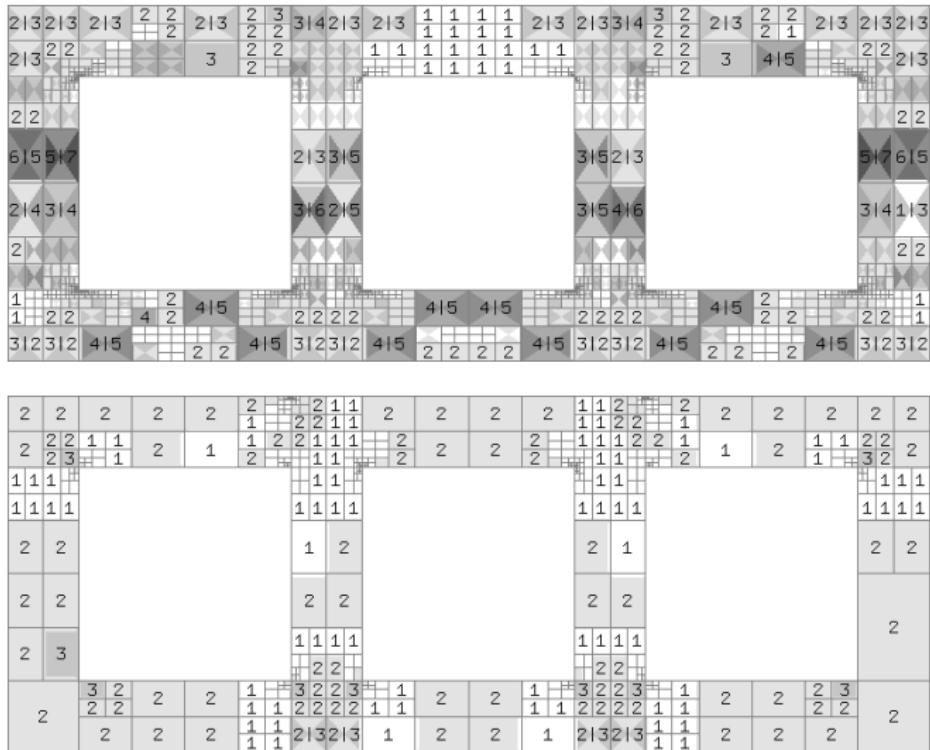

# Thermoelasticity (step 12)

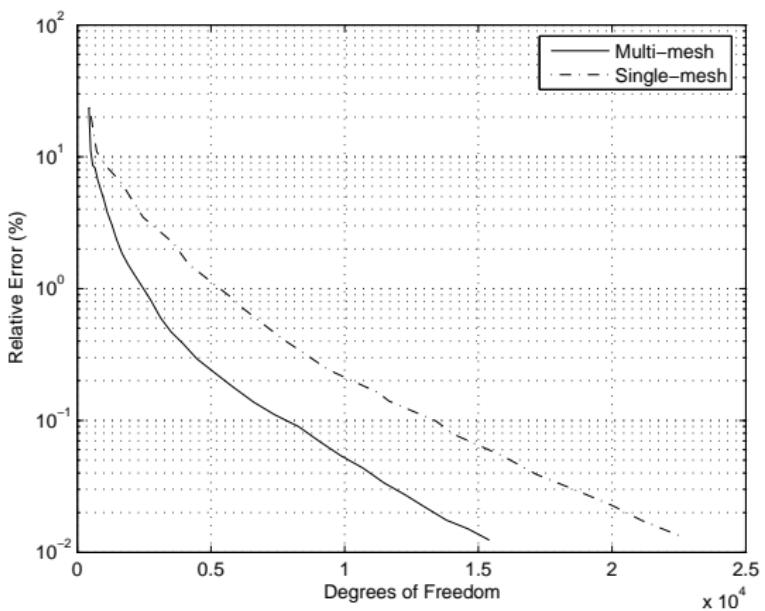

# Thermoelasticity (step 13)

# Thermoelasticity (step 14)

# Convergence: multi-mesh vs. single-mesh

# Rothe's method

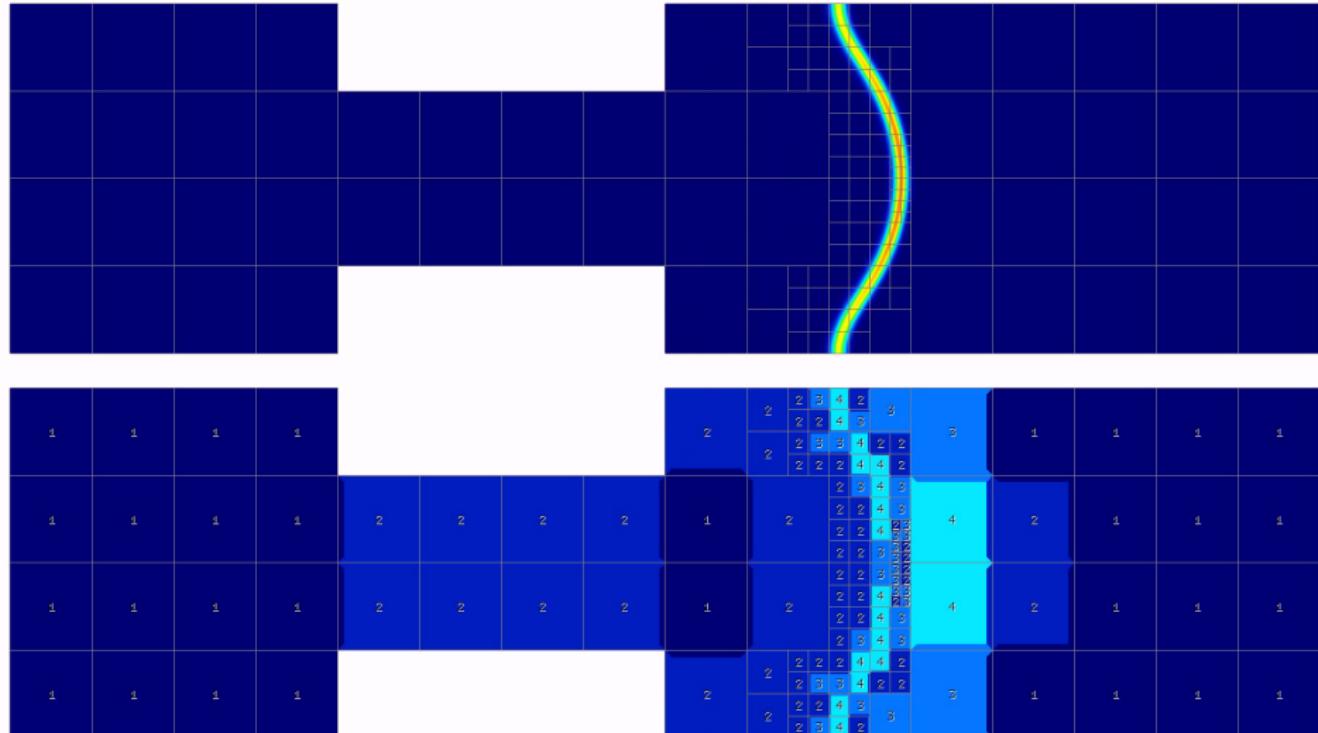

- Approximate a time-dependent PDE with time-independent one(s).
- Illustration:  $\frac{\partial u}{\partial t} - \Delta u = f$

$$\frac{\partial u}{\partial t} \approx \frac{u^{n+1} - u^n}{\Delta t} \Rightarrow -\Delta t \Delta u^{n+1} + u^{n+1} = u^n + \Delta t f^{n+1}$$

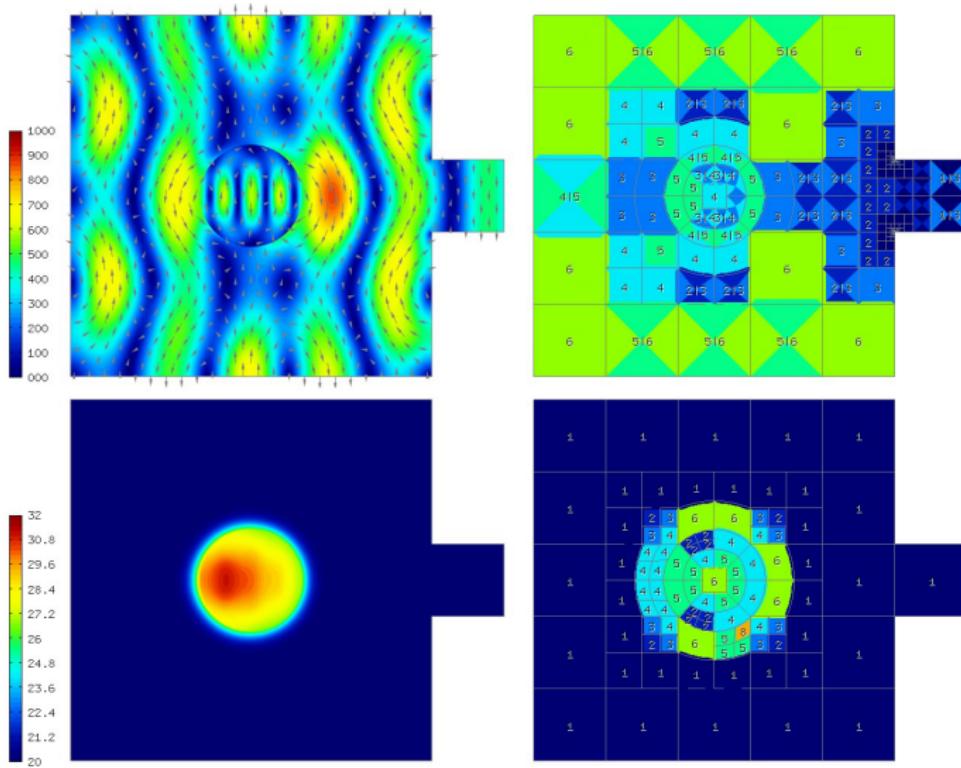

$$\frac{\partial u}{\partial t} \approx \frac{3u^{n+2} - 4u^{n+1} + u^n}{2\Delta t} \Rightarrow -2\Delta t \Delta u^{n+2} + 3u^{n+2} = 4u^{n+1} - u^n + 2\Delta t f^{n+2}$$

- Time-independent PDEs solved using *spatial adaptivity*
- “Simultaneous mesh refinement and coarsening”
- Adaptive control of time step as in embedded ODE methods
