Call for bilateral projects between DIT and Inria Sophia Antipolis-Méditerranée

Funding between July 2013-July 2014

We are glad to announce that all three proposals are funded at the requested levels, i.e. 5000 Euro per team. The three projects are:

- Discriminating and Classifying in High-dimensional Spaces (ABS -- Theodoridis)
- Algorithms Design and Games for Location, Placement and Infrastructure Leasing (COATI -- Zisimopoulos)
- Algebraic algorithms in optimization (GALAAD -- Emiris)

The projects were well described and tackled innovative and interesting research problems involving different research and applications domains. Research-wise, they all look good and promising. As the main goal of this call has been to strengthen the ties between Inria and UoA-DIT, we felt that this is accomplished well, since both new interactions are being initiated and older interactions are moving forward with new initiatives.

We ask that all projects submit a 1-2 page report by July 2014 outlining the outcomes and the benefits of these collaborations. Moreover, we also ask to have some feedback (midterm report or email update) in May 2014.
