PmWiki: I18n Variables

This page describes the variables used by PmWiki for Internationalizations (i18n).

\$VarPagesFmt

An array which contains the PageNames where you can find variable definitions. To be modified when documentation is not in english. See *scripts/vardoc.php*.

\$XL

An array (hash) which contains pairs of language identifiers and translation hashes. Each translation hash maps a given lookup key (or phrase) into a corresponding text string for the given language. Thus, it is essentially a multi-lingual dictionary used for phrase translation. It is also used for handling user preference mappings. Thus, the 'e_row' value that one finds on the Site.Preferences page is loaded into \$XL during preference processing.

\$XLLangs

An array that contains the names of the currently active language definitions. Only dictionaries in \$XL that are named in \$XLLangs are used by the \$[...] markup when performing a translation.
