PmWiki: Wiki Word

Definition and use as Page Titles

A WikiWord is a set of two or more words run together, where the first letter of each word is capitalized. This syntax is also sometimes referred to as "mixed case" or "camel case". WikiWords are used as **page titles** in a WikiWikiWeb.

Use as links

In some wikis, you can string any sequence of words together, capitalizing the first letter of each word, to make a valid WikiWord **link**. In such PmWiki installations, WikiWords surrounded by [=...=] or preceded by a backquote (`) are not turned into links:

```
LikeThis compared to `LikeThis or even [=LikeThis=]
```
LikeThis compared to LikeThis or even LikeThis

See Links for information about PmWiki's rules for forming links and forming page titles.

Enabling WikiWord links

WikiWord links are disabled by default since Pmwiki version 2.1 beta2. To enable WikiWord links you need to set in *config.php*

```
$LinkWikiWords = 1;
```
If you want to display links to non-existent pages without decoration, place the following lines in *pub/css/local.css*:

```
span.wikiword a.createlink { display:none; }
span.wikiword a.createlinktext { border-bottom:none; text-decoration:none; color:inherit; }
```

Finding WikiWord links

If you upgraded from an earlier version and want to convert WikiWord links to standard links, the following will help to find those WikiWord links easier by highlighting them. Set in *config.php*:

```
$HTMLStylesFmt['wikiword'] = "span.wikiword { background:yellow; }";
```
Disabling certain WikiWords

The variable $WikiWordCount controls WikiWord conversion on a per word basis.

Other descriptions of WikiWords are available from Wiki:WikiWord and Wikipedia:WikiWord.
