A WEB OF RESOURCES

W3C®

URL

identify what
exists on the web.

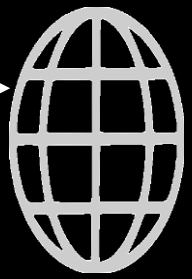
http://my-site.fr

URL → URI

identify what
exists on the web.

identify,
on the web,
what exists.

http://my-site.fr



http://animals.org/zebra#this

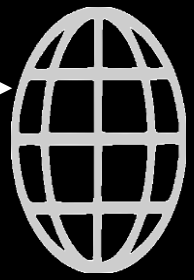
URL → URI → IRI

identify what exists on the web.

identify, on the web, what exists.

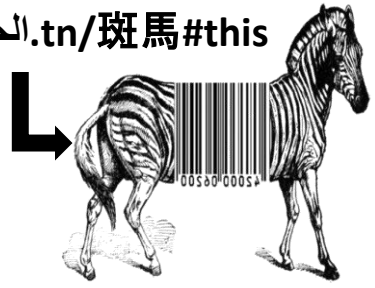
identify, on the web, in any language, what exists.

http://my-site.fr



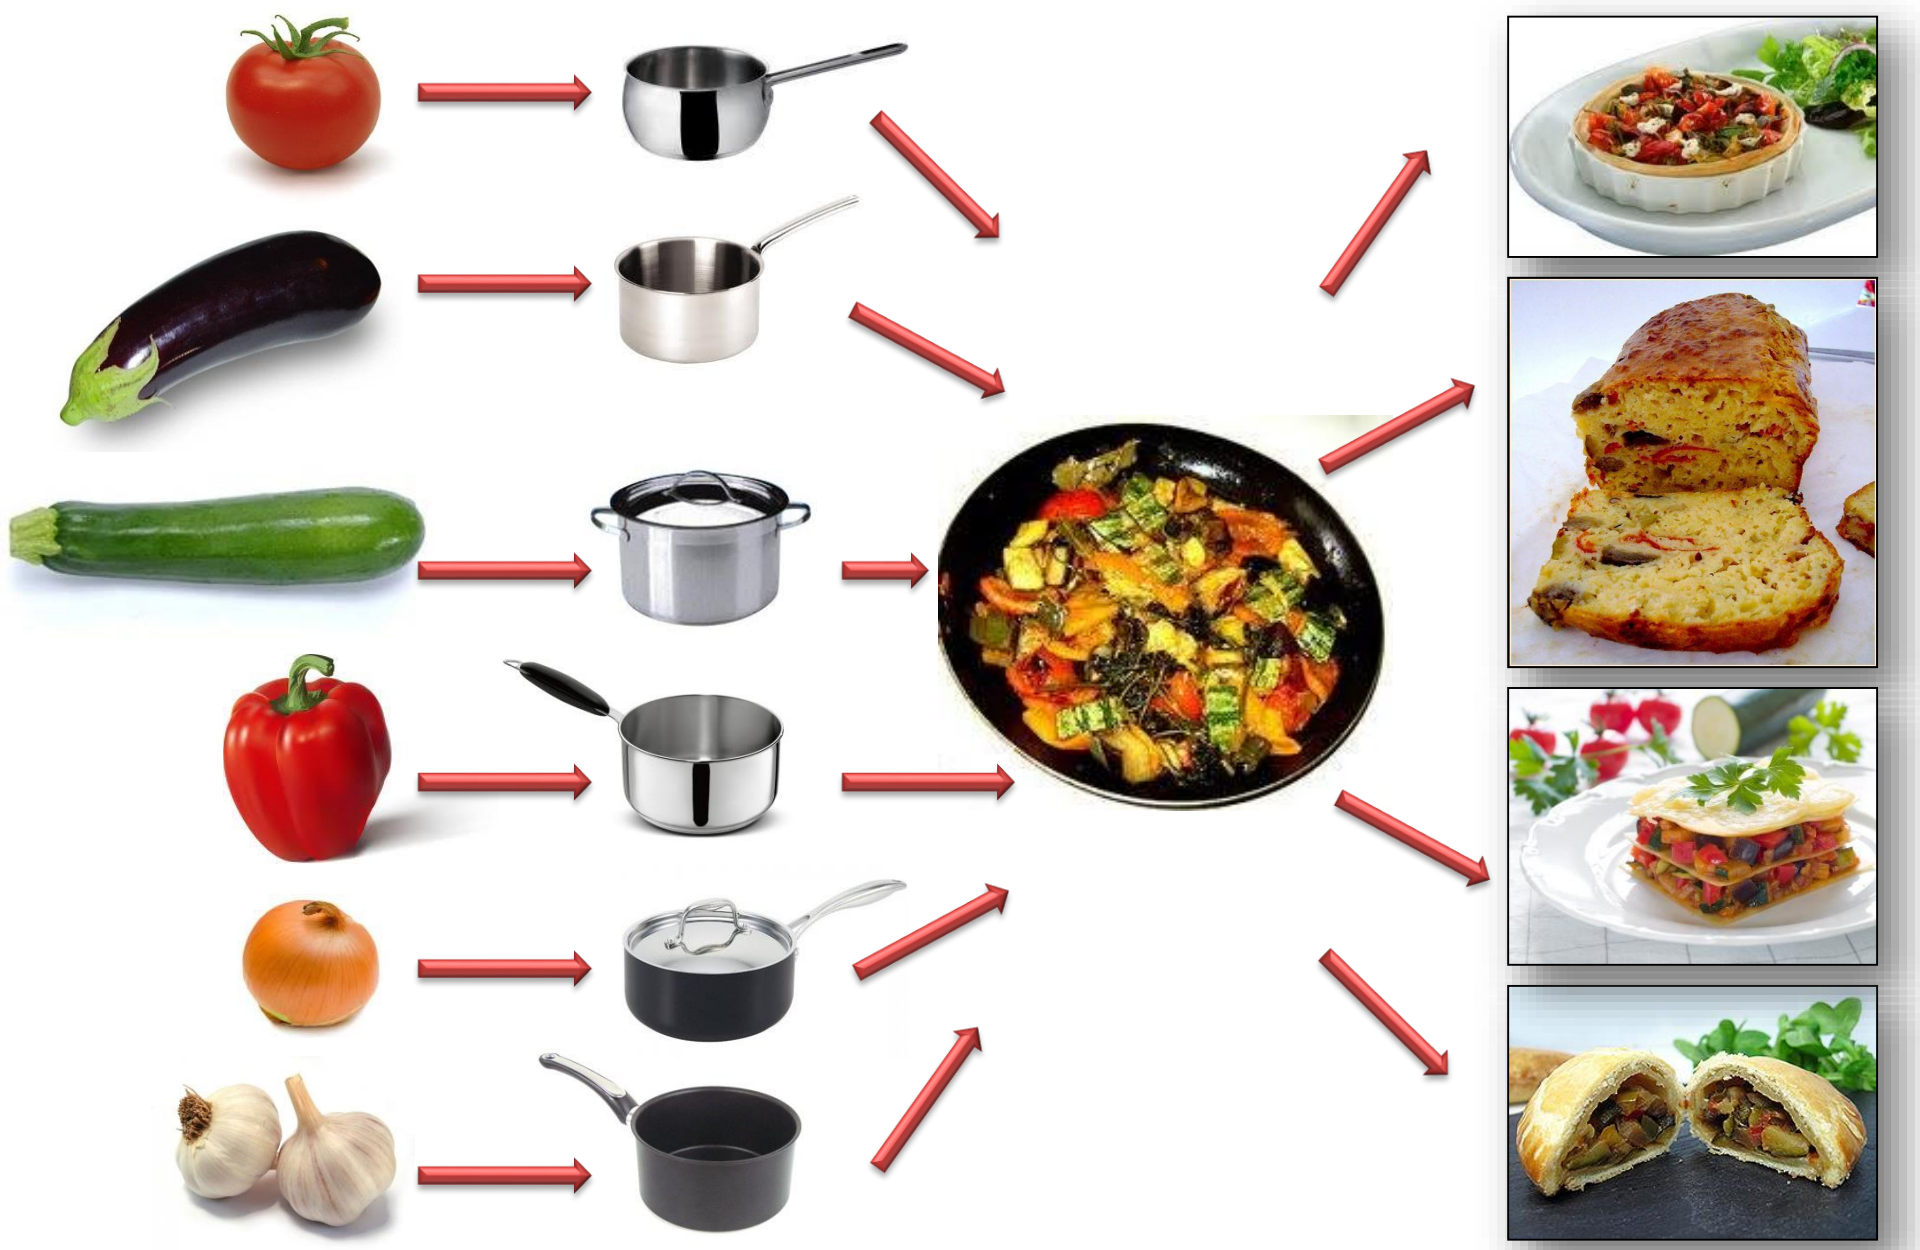
http://animals.org/zebra#this

http://الحيوانات.tn/斑馬#this

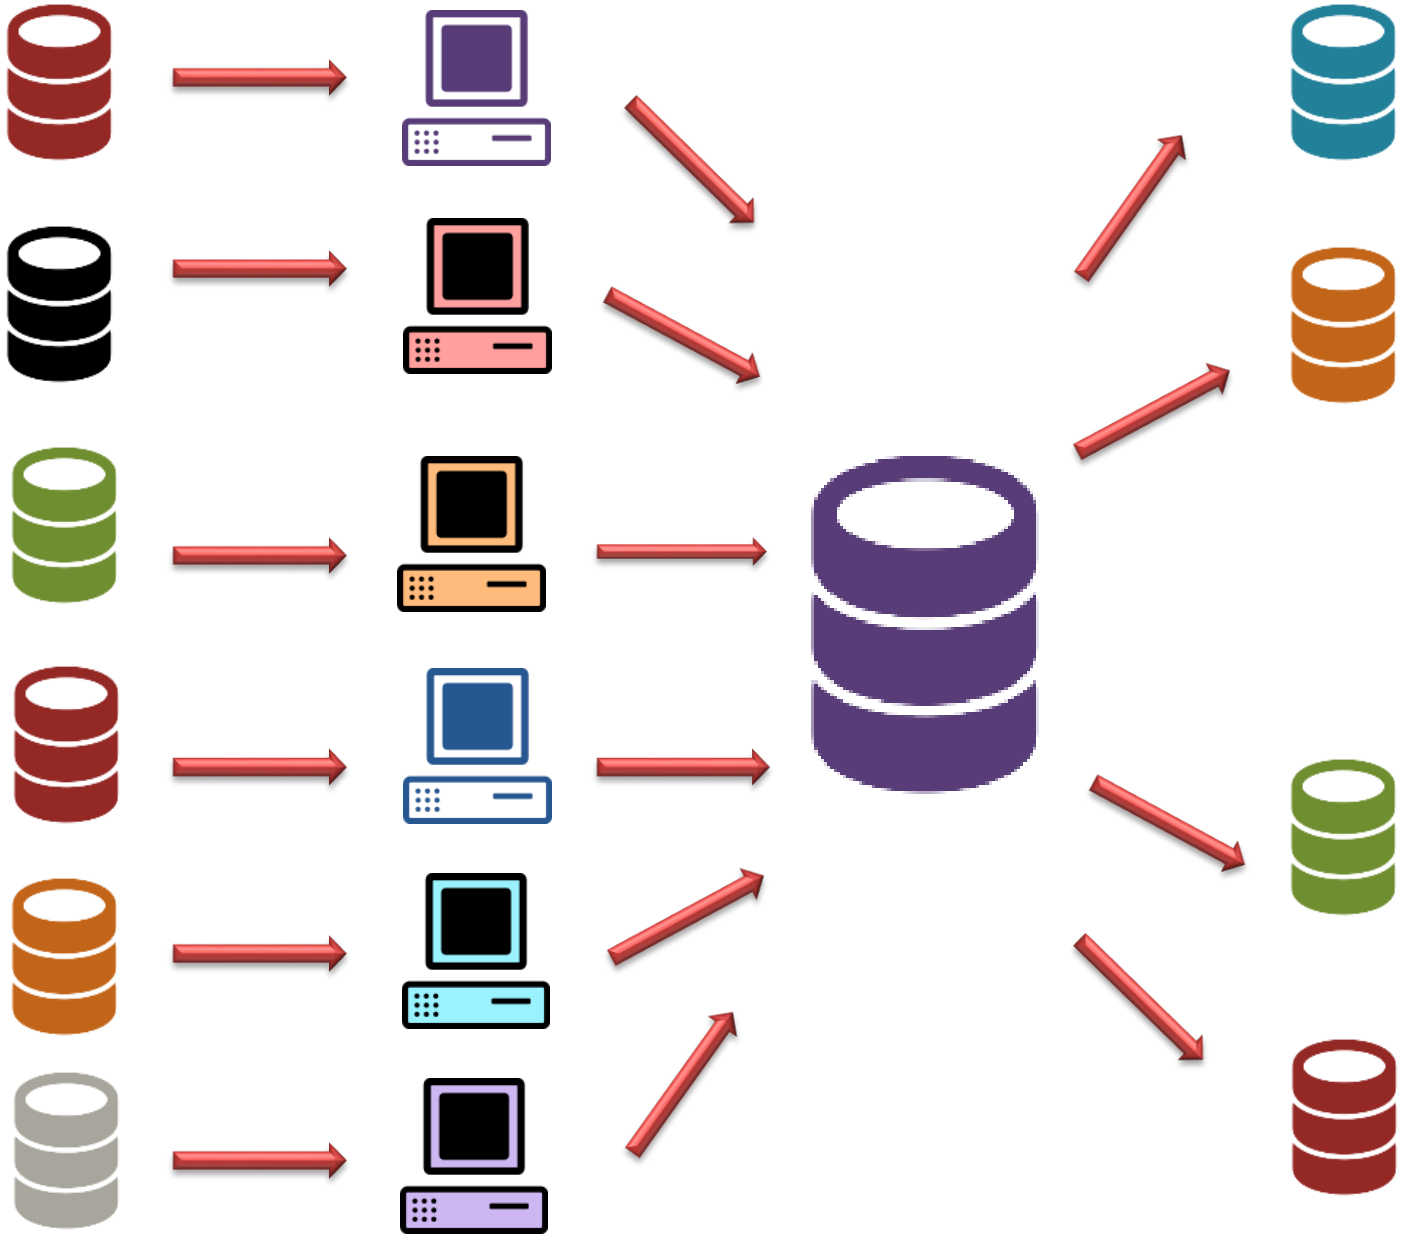


URL → URI → IRI

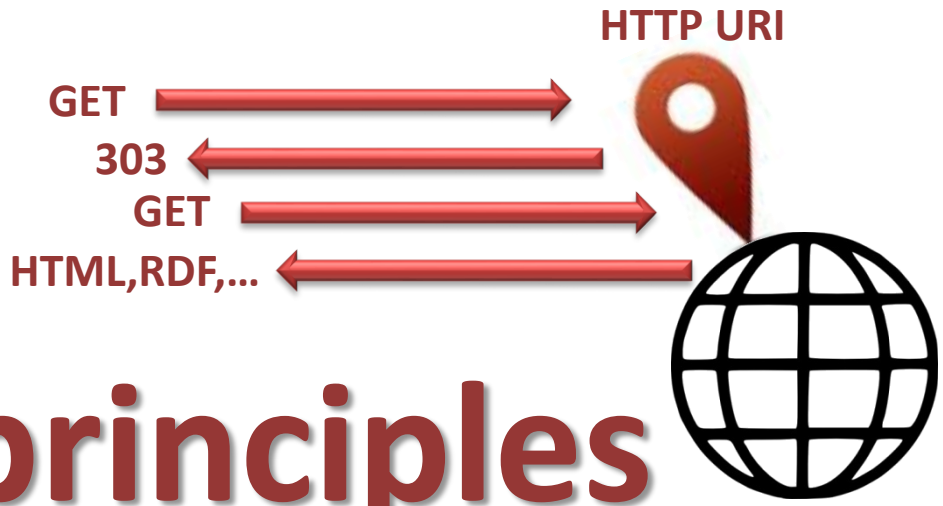
RESOURCE



ratatouille.fr



datatouille.fr

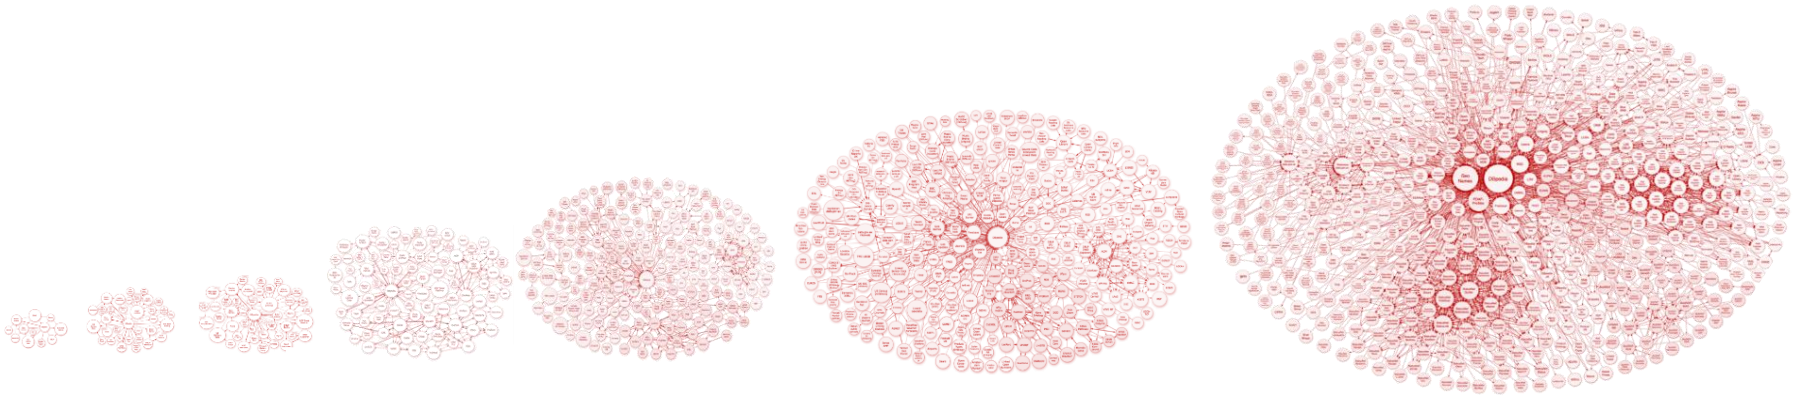


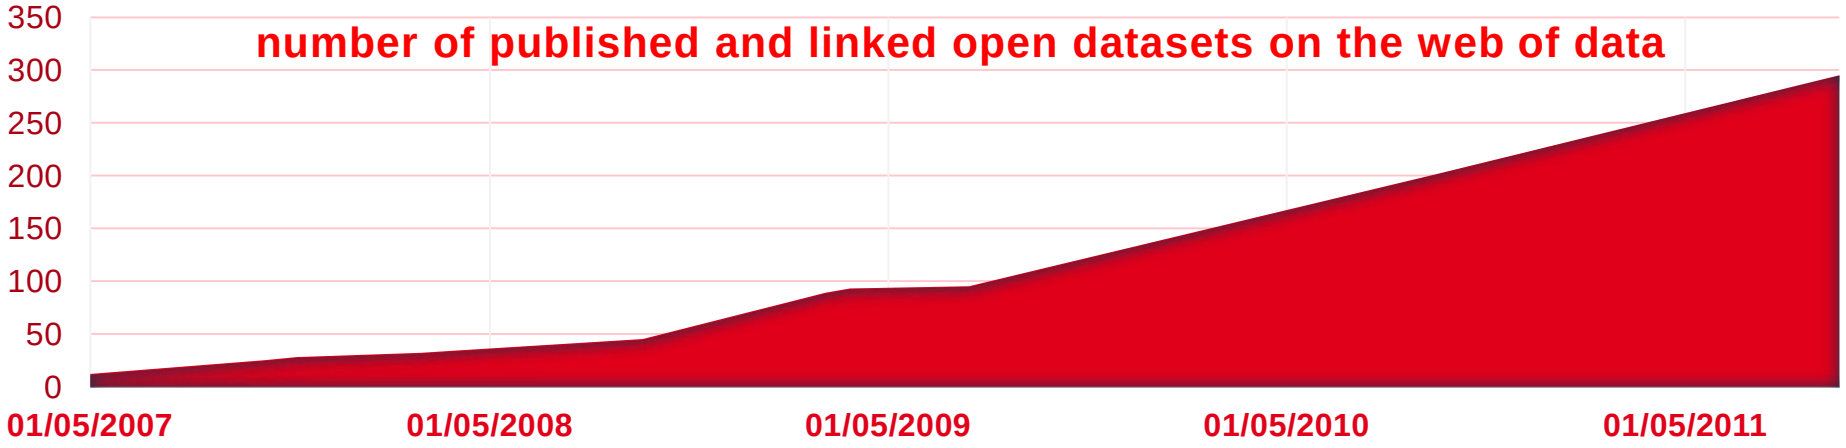
linked data principles

- Use **RDF** as data format
- Use **HTTP URI**s as names for things so that people can look up those names
- When someone looks up a URI, provide useful information (RDF, HTML, etc.) using **content negotiation**
- Include **links to other URIs** so that related things can be discovered

a web of linked data …

we publish and link structured resource descriptions





thematic content

Domains	Number of datasets	Number of Triples	%	Out links	%
Media	25	1 841 852 061	5,82 %	50 440 705	10,01 %

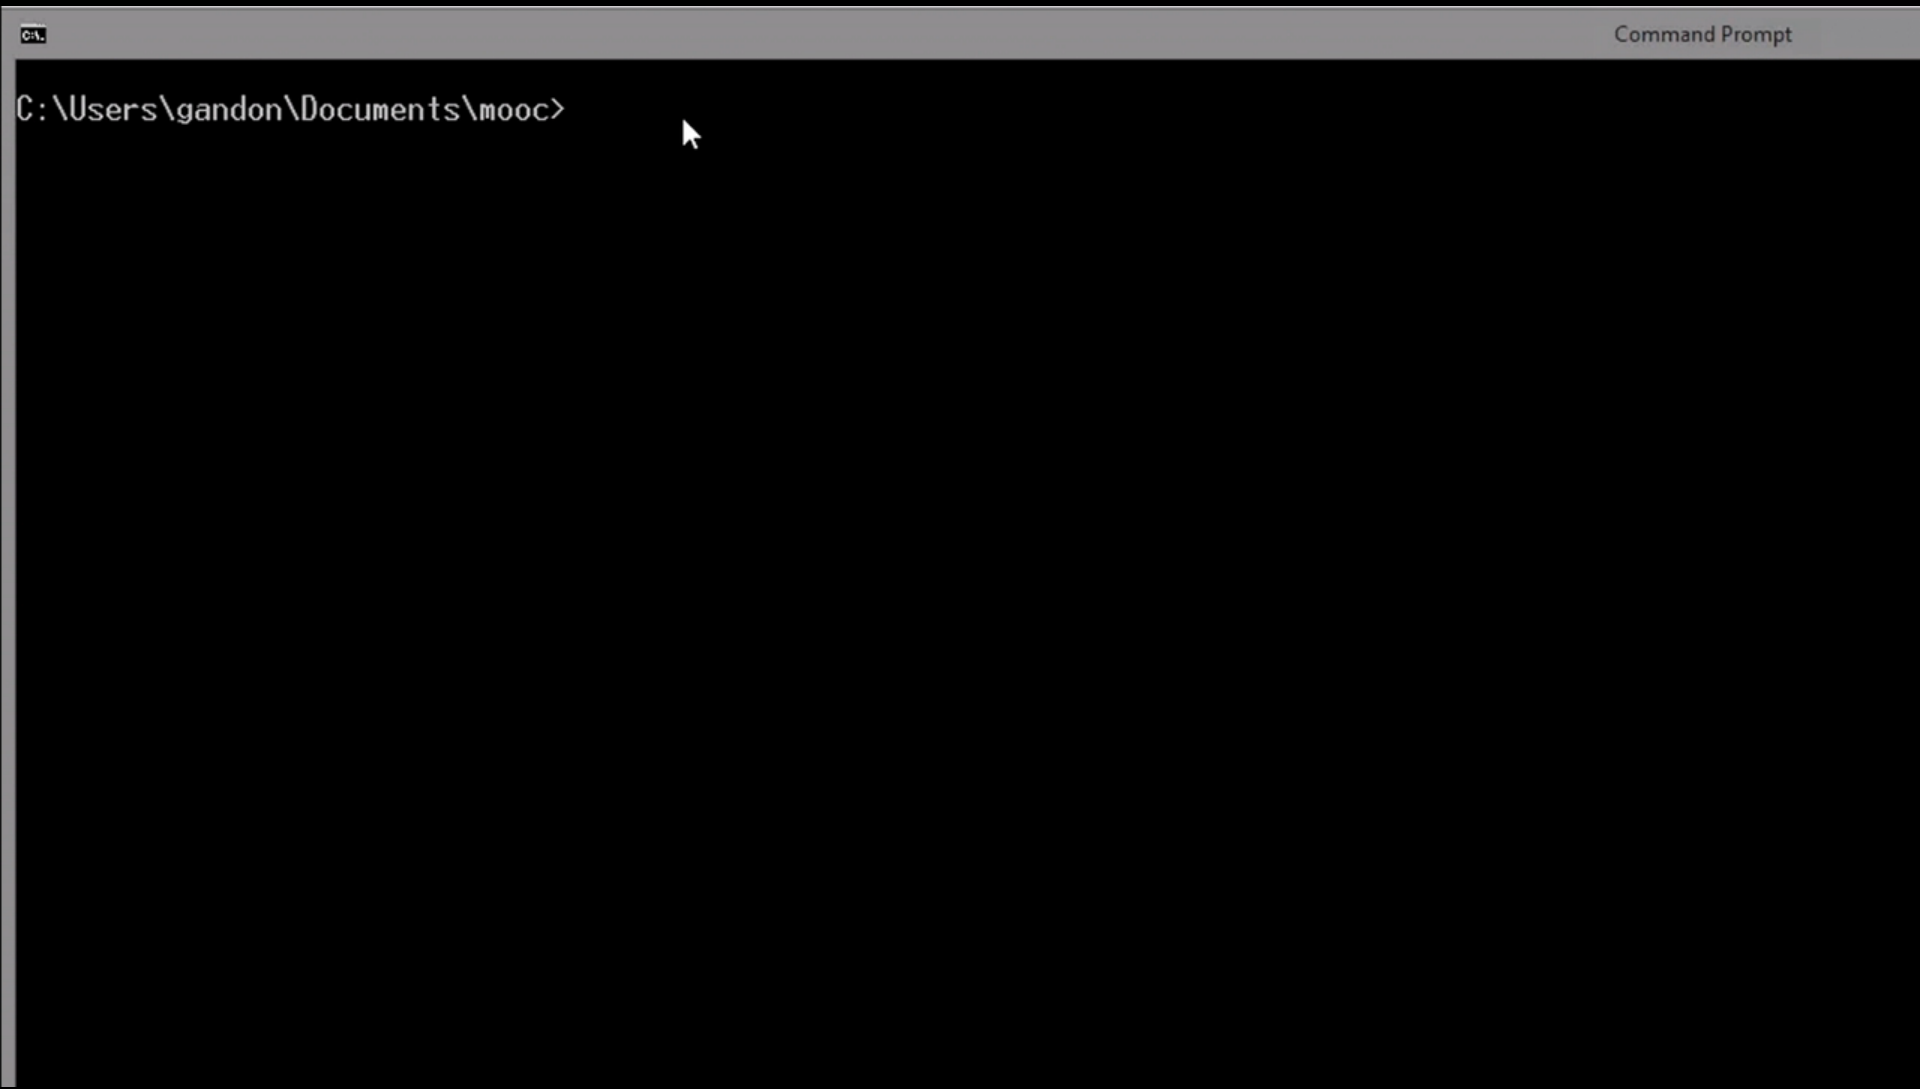
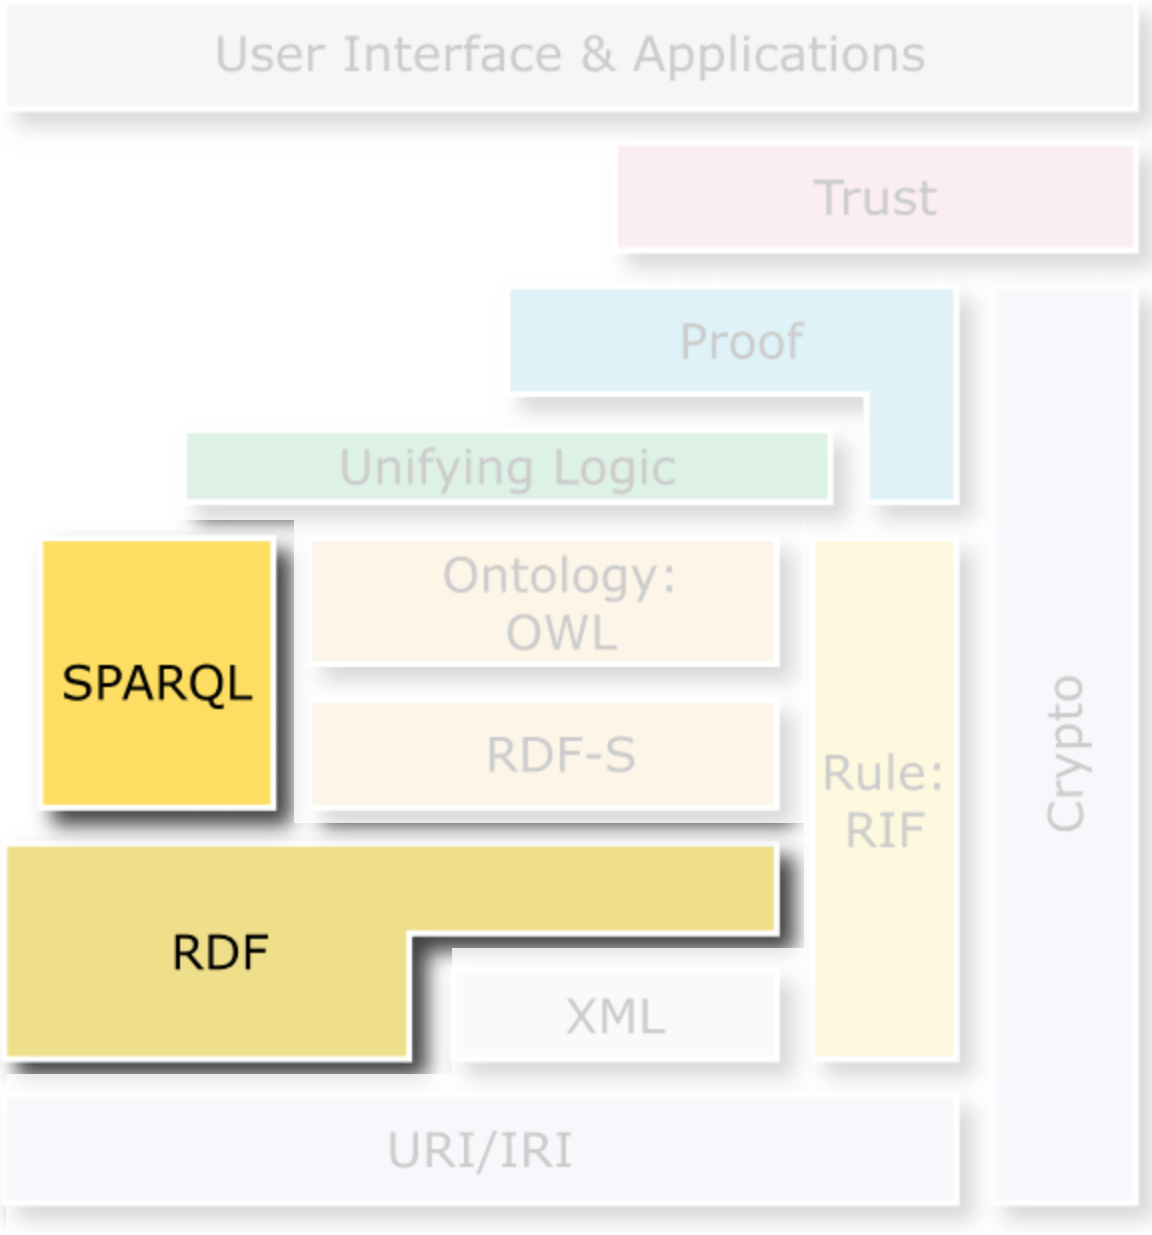
using CURL to fetch data



what is the latest identification standard on the Web?

A WEB OF LINKED DATA



W3C®

RDF stands for

Resource: *pages, dogs, ideas... everything that can have a URI*

Description: *attributes, features, and relations of the resources*

Framework: *model, languages and syntaxes for these descriptions*

RDF is a triple model *i.e.* every piece of knowledge is broken down into

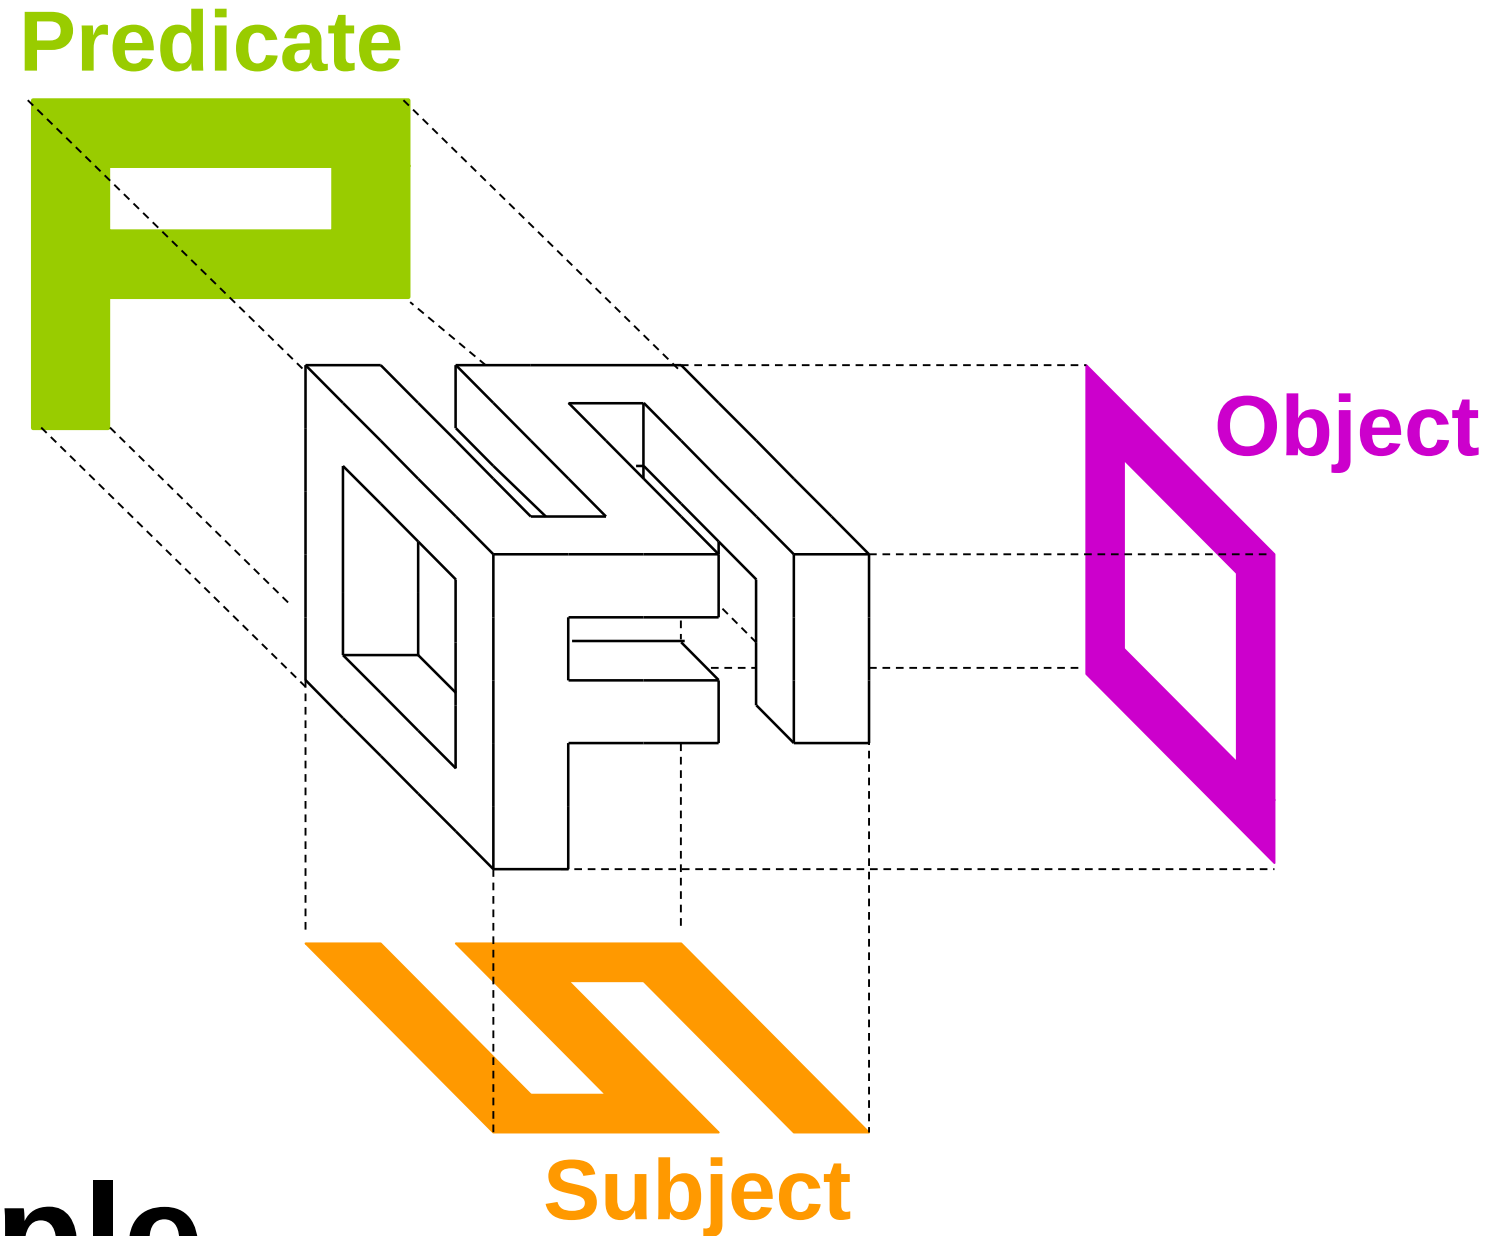
(subject , predicate , object)

doc.html has for author Fabien and has for theme Music

doc.html has for author Fabien
doc.html has for theme Music

(doc.html , author , Fabien)
(doc.html , theme , Music)

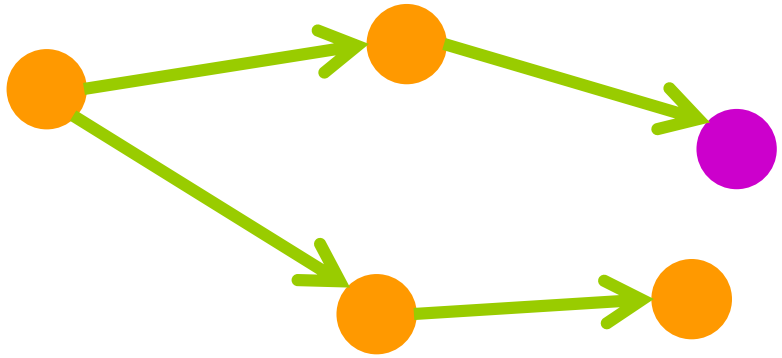
(subject , predicate , object)



a triple

the RDF atom

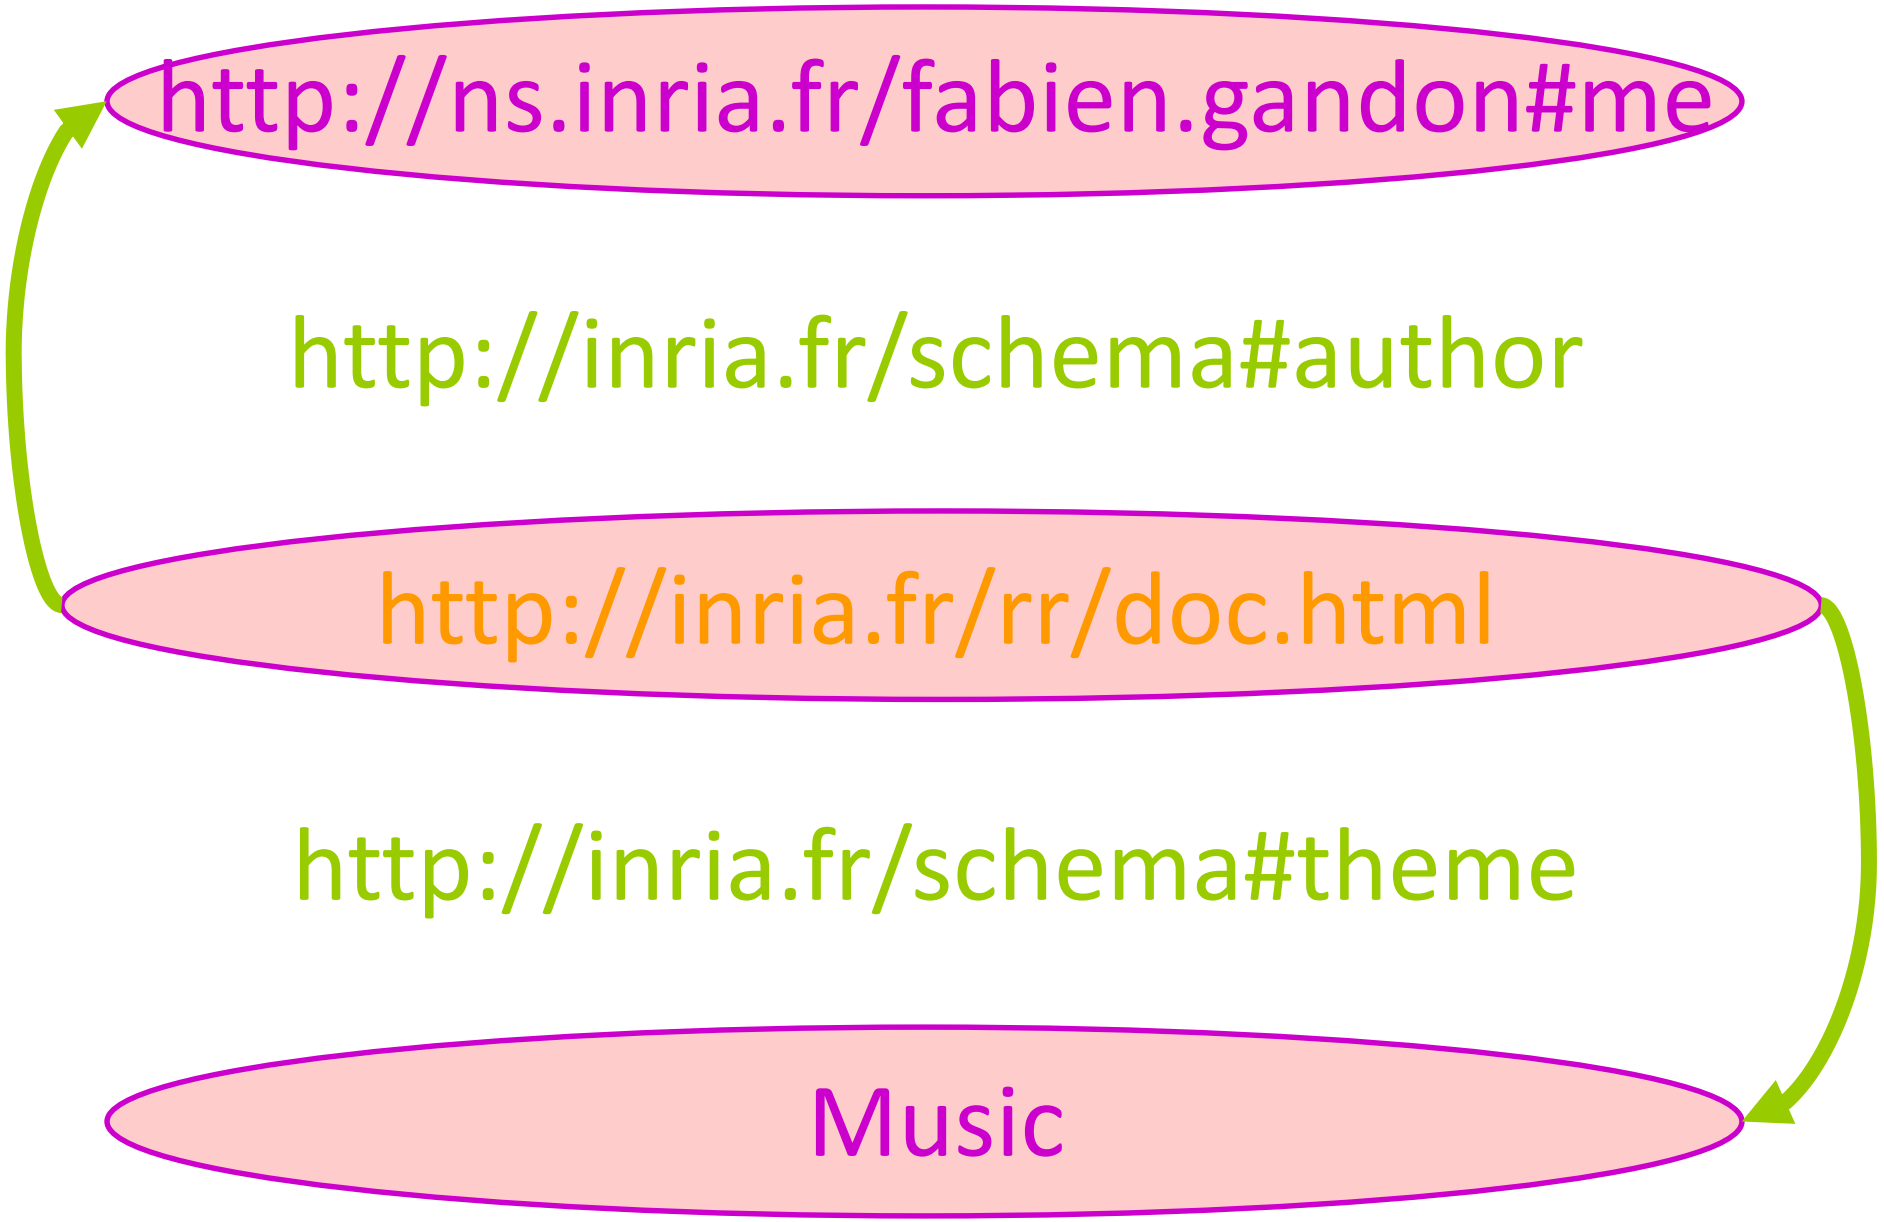
RDF is also a graph model
to link the descriptions of resources



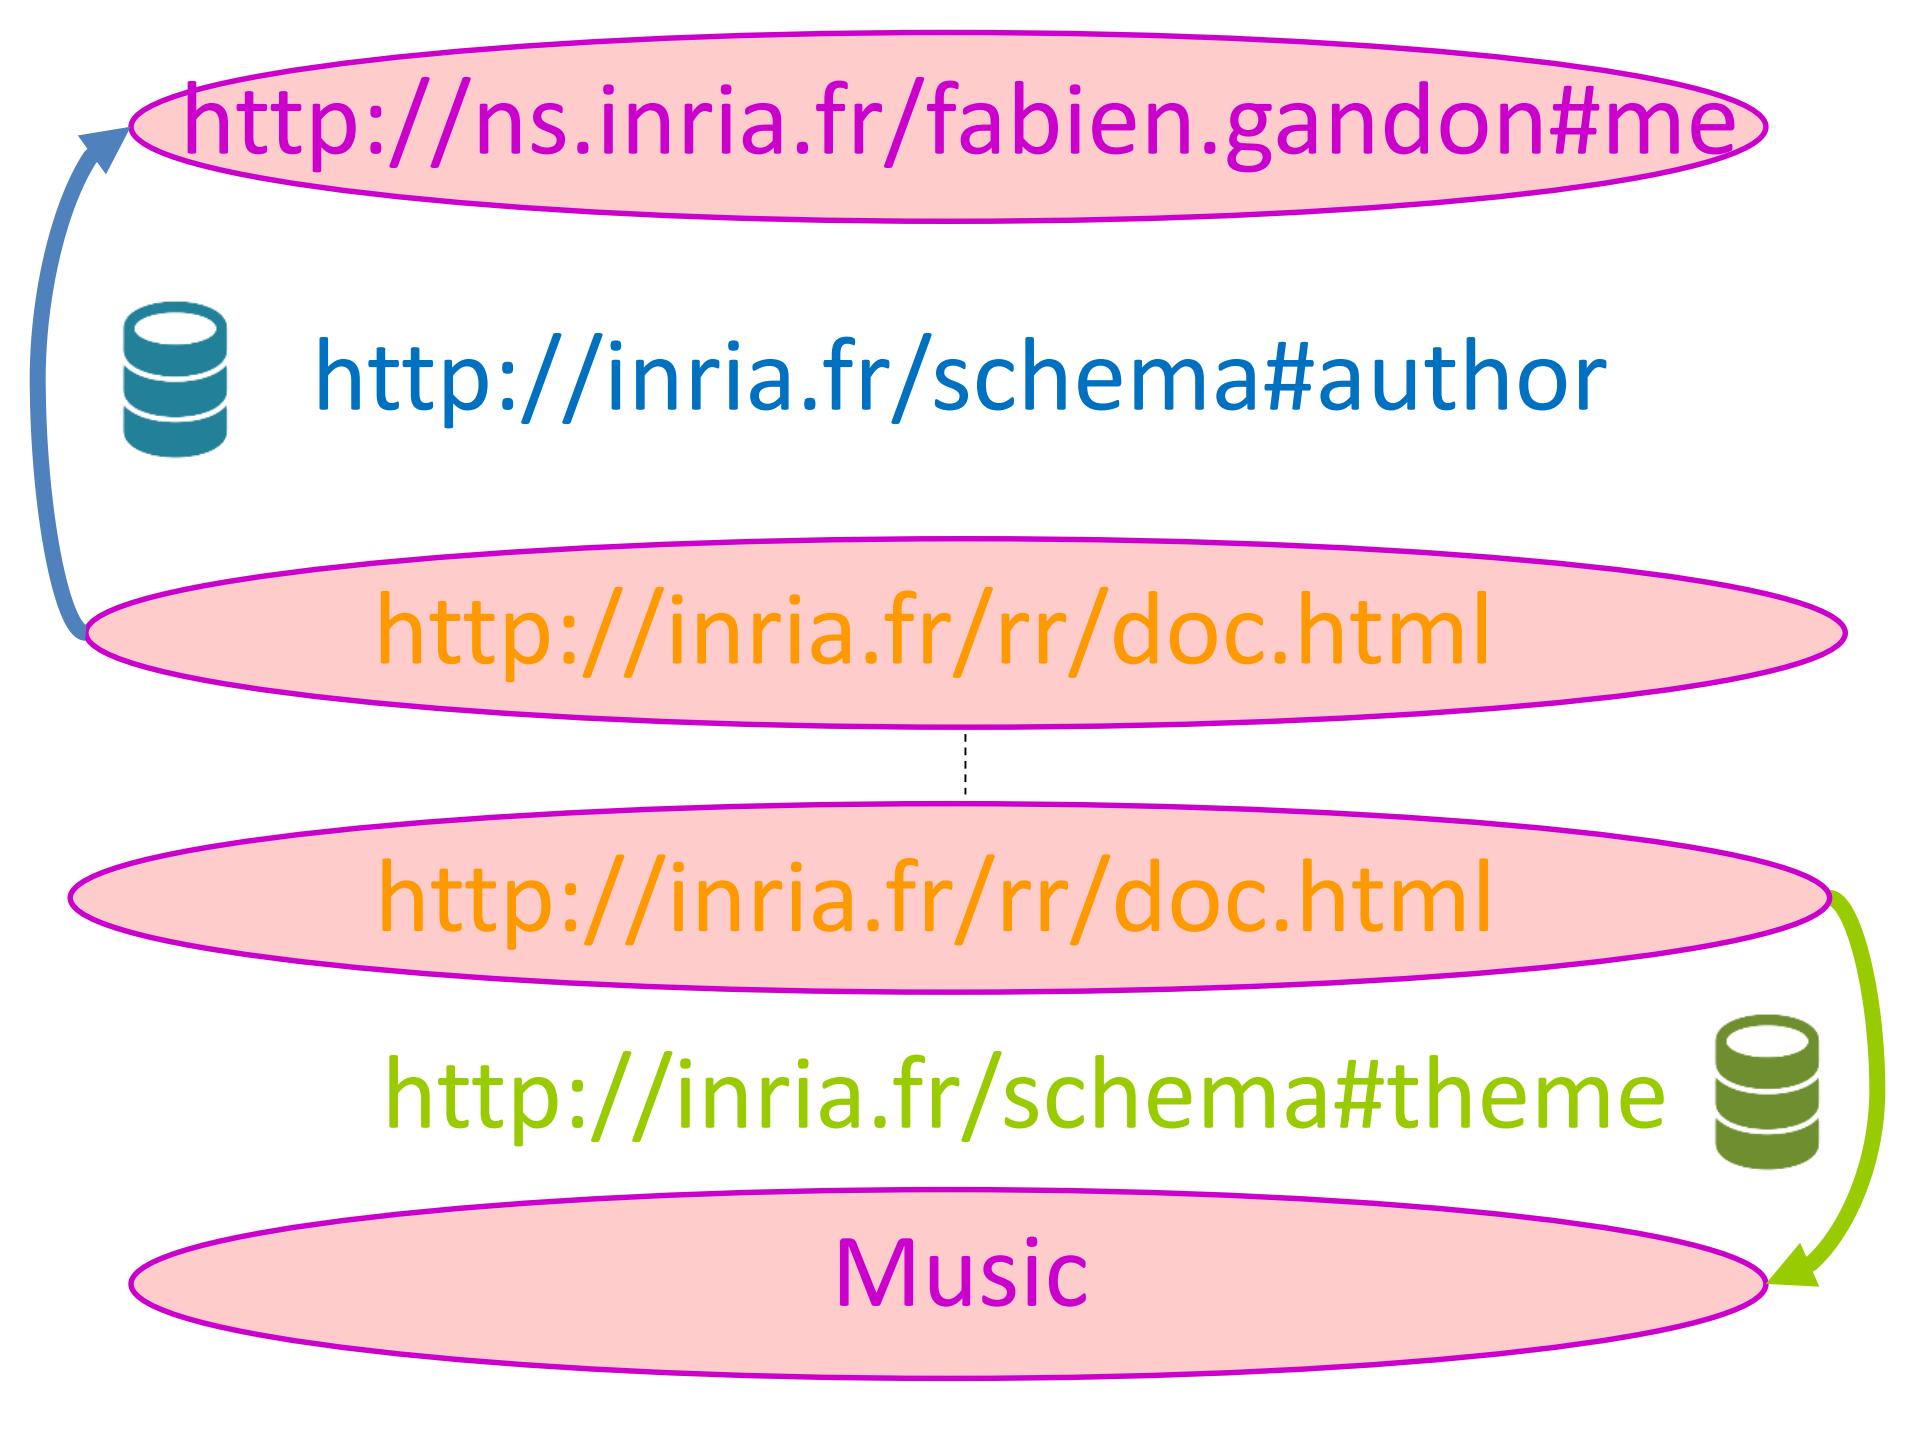
RDF triples can be seen as arcs of a graph (vertex,edge,vertex)

(doc.html , author , Fabien)
(doc.html , theme , Music)

Fabien
author
doc.html
theme
Music



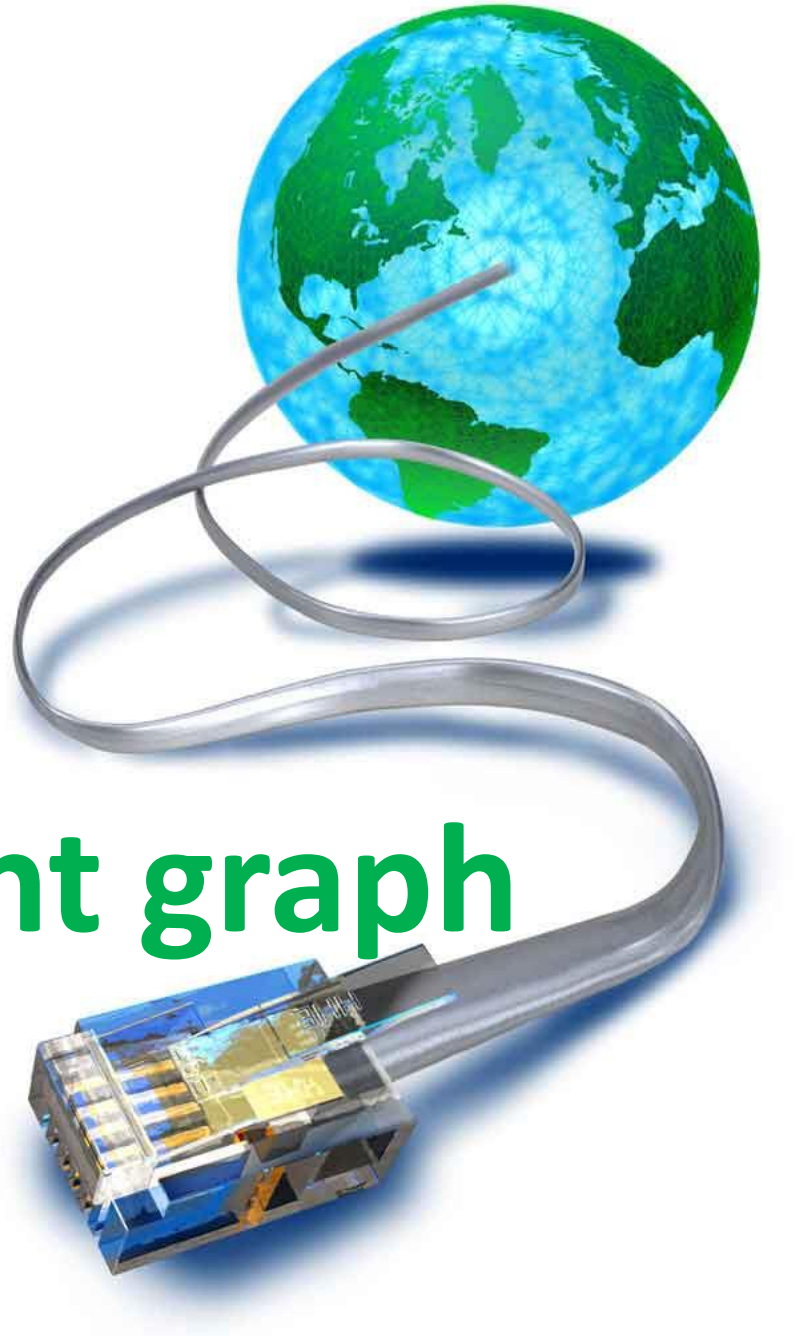
http://ns.inria.fr/fabien.gandon#me
http://inria.fr/schema#author
http://inria.fr/rr/doc.html
http://inria.fr/schema#theme
Music



http://ns.inria.fr/fabien.gandon#me
http://inria.fr/schema#author
http://inria.fr/rr/doc.html
http://inria.fr/rr/doc.html
http://inria.fr/schema#theme
Music

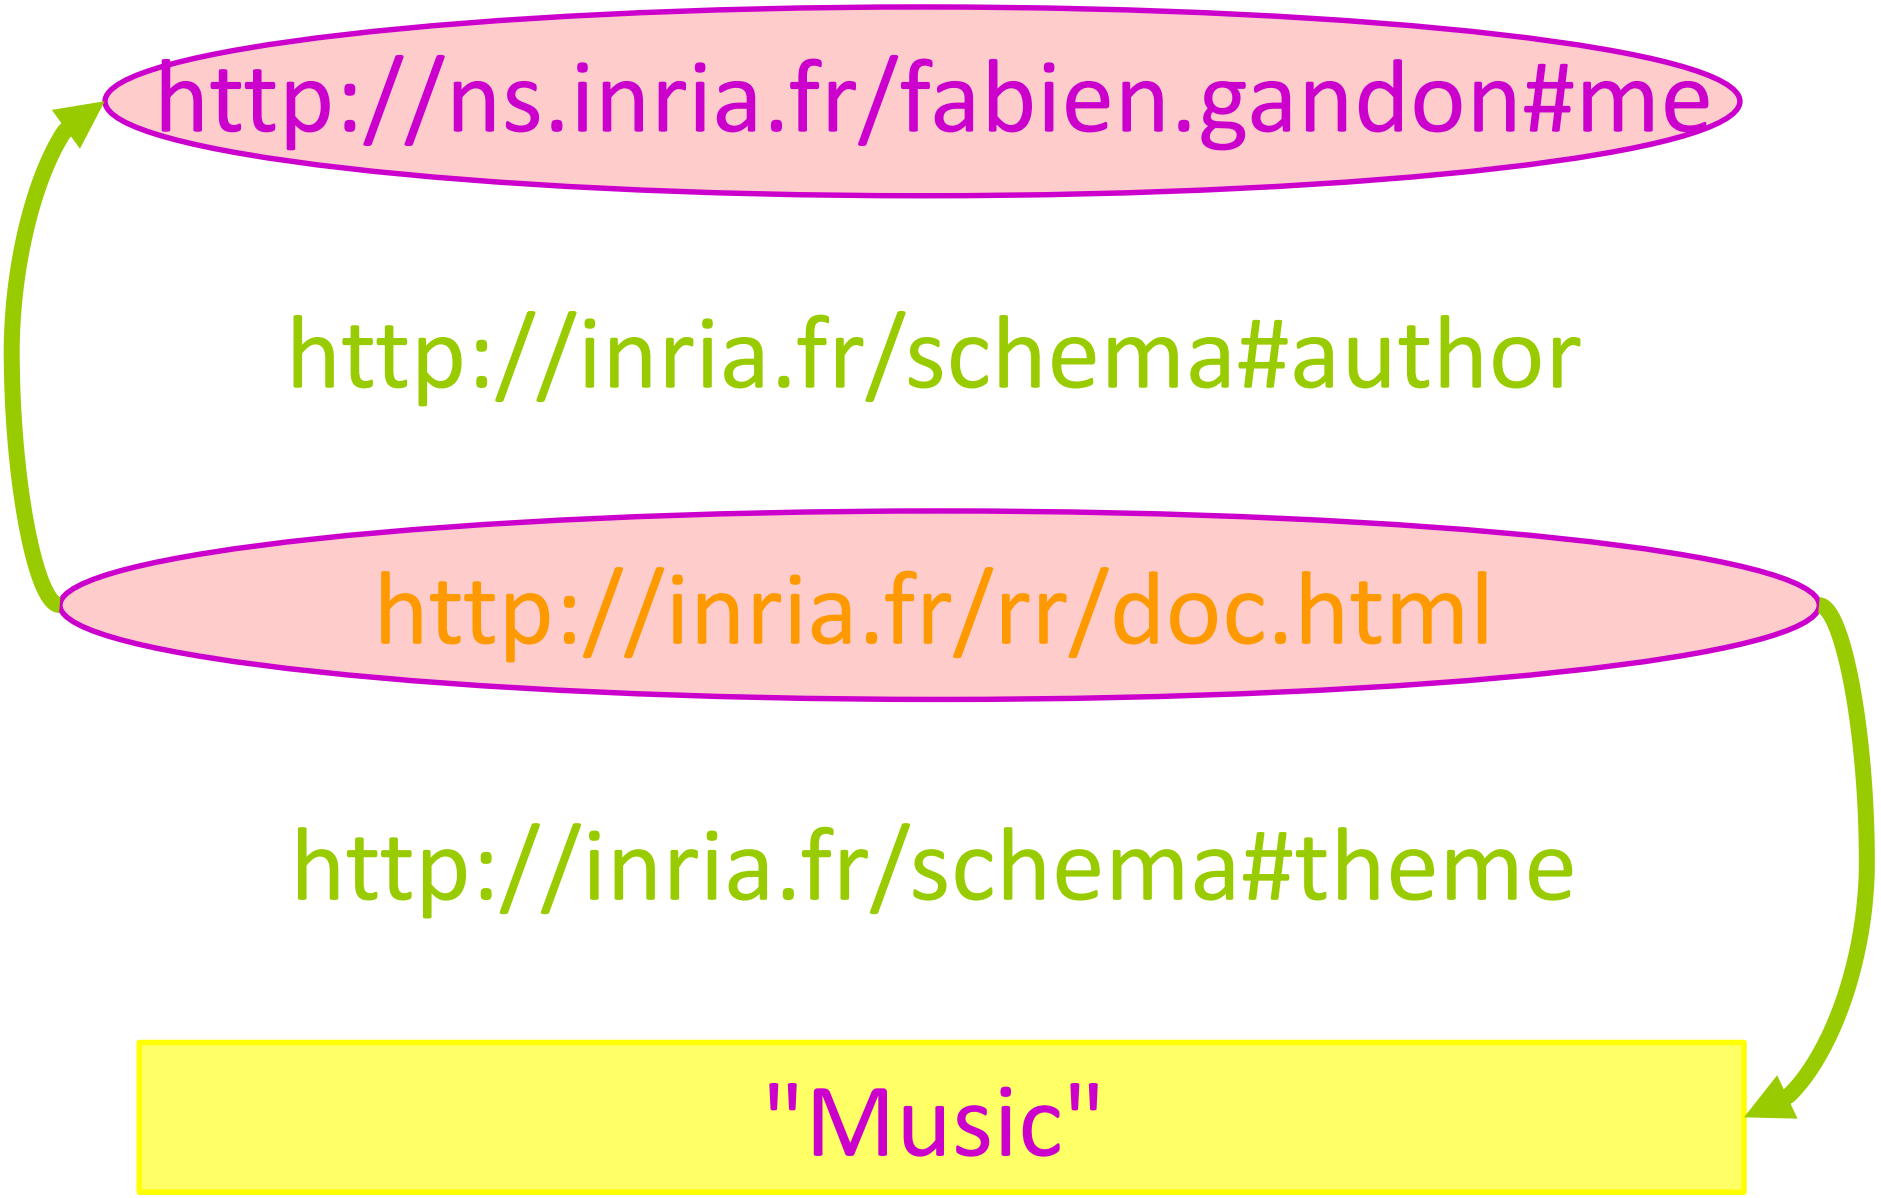
open and link data in a

global giant graph



in RDF values of properties can also be literals i.e. strings of characters

(doc.html , author , Fabien)
(doc.html , theme , "Music")



http://ns.inria.fr/fabien.gandon#me
http://inria.fr/schema#author
http://inria.fr/rr/doc.html
http://inria.fr/schema#theme
"Music"

< RDF /> has an XML syntax

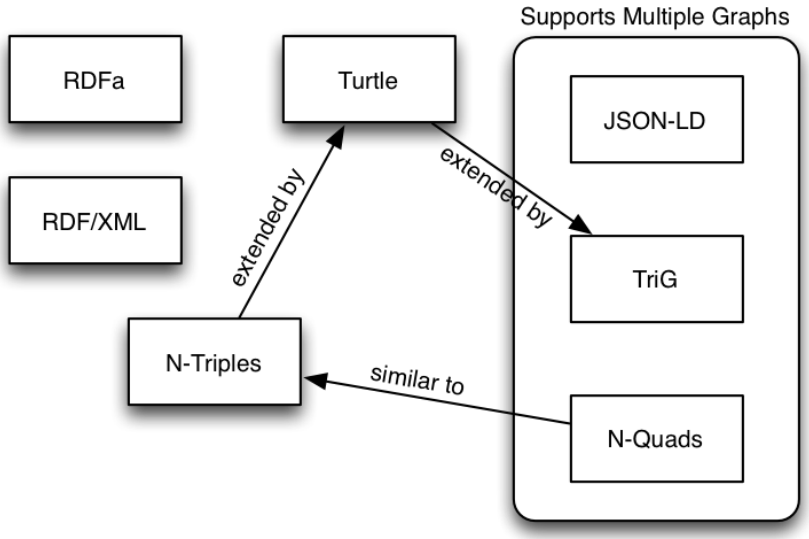
```
<rdf:RDF
  xmlns:rdf="http://www.w3.org/1999/02/22-
  rdf-syntax-ns#"
  xmlns:inria="http://inria.fr/schema#" >

<rdf:Description
 rdf:about="http://inria.fr/rr/doc.html">
  <inria:author rdf:resource=
   "http://ns.inria.fr/fabien.gandon#me"/>
   <inria:theme>Music</inria:theme>
</rdf:Description>

</rdf:RDF>
```

RDF has other syntaxes

(Turtle, TriG, N-Triples, N-Quads, JSON, RDFa)



```
@prefix rdf:
  <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
@prefix inria: <http://inria.fr/schema#> .

<http://inria.fr/rr/doc.html>
 inria:author
   <http://ns.inria.fr/fabien.gandon#me> ;
 inria:theme "Music" .
```

Turtle

```
<http://inria.fr/rr/doc.html>
 <http://inria.fr/schema#author>
   <http://ns.inria.fr/fabien.gandon#me> .

<http://inria.fr/rr/doc.html>
 <http://inria.fr/schema#theme> "Music" .
```

N-Triples

writing rules for RDF triples

- the subject is always a resource (never a *literal*)
- properties are binary relations and their types are identified by URIs
- the value is a resource or a literal

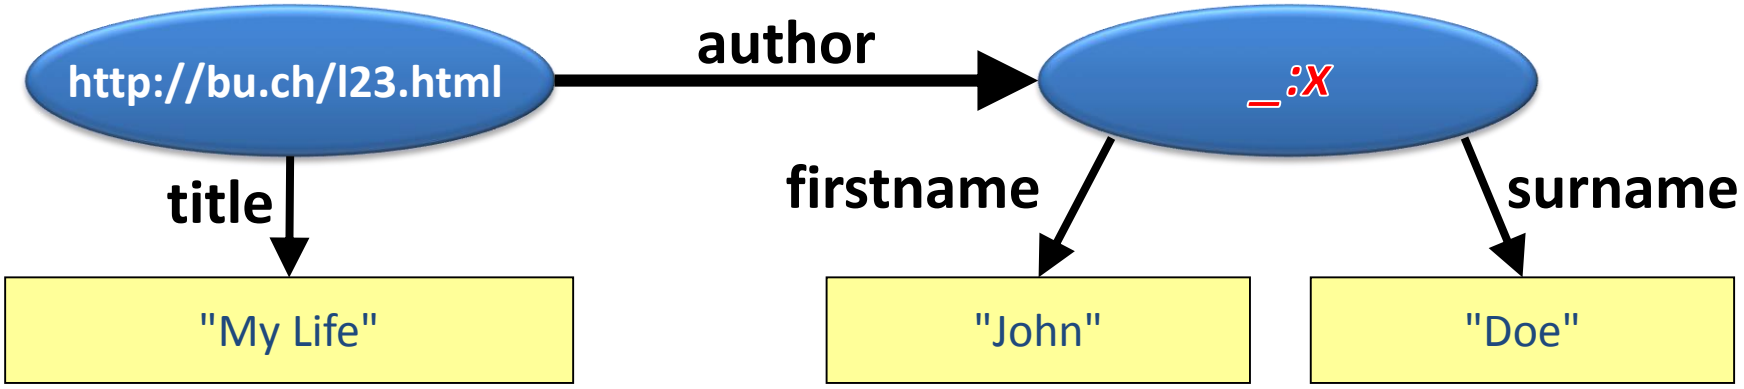
blank nodes (bnodes)

handy anonymous nodes (existential quantification)

there exist a resource such that… { ∃ r ; …}

```
<rdf:Description rdf:about="http://bu.ch/123.html ">
 <author>
  <rdf:Description>
   <surname>Doe</surname>
   <firstname>John</firstname>
  </rdf:Description>
 </author>
 <title>My Life</title>
</rdf:Description>
```

<http://bu.ch/123.html>
author
[surname "Doe" ;
firstname "John" .] ;
title "My Life" .



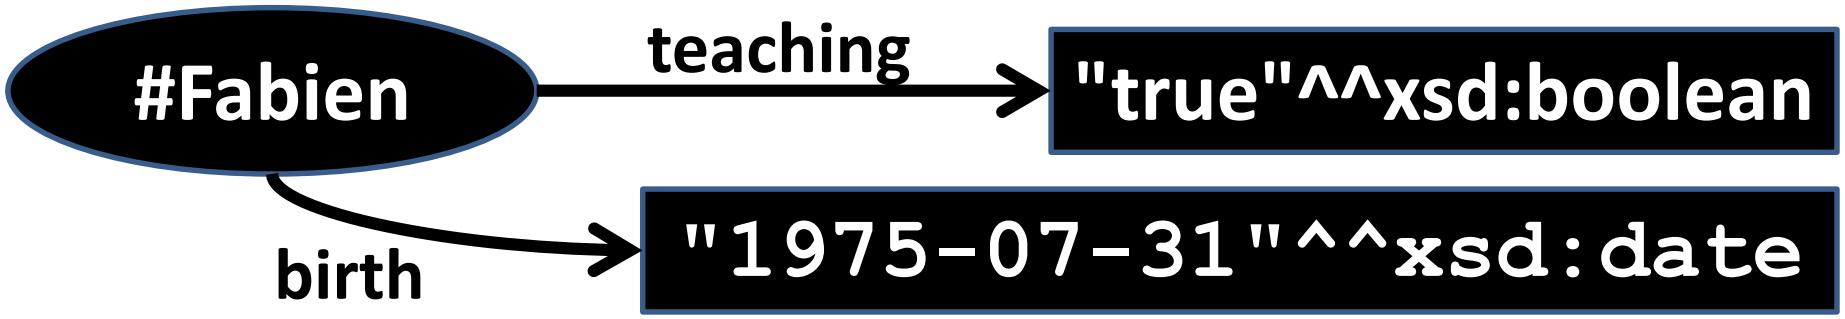
XML schema datatypes & literals

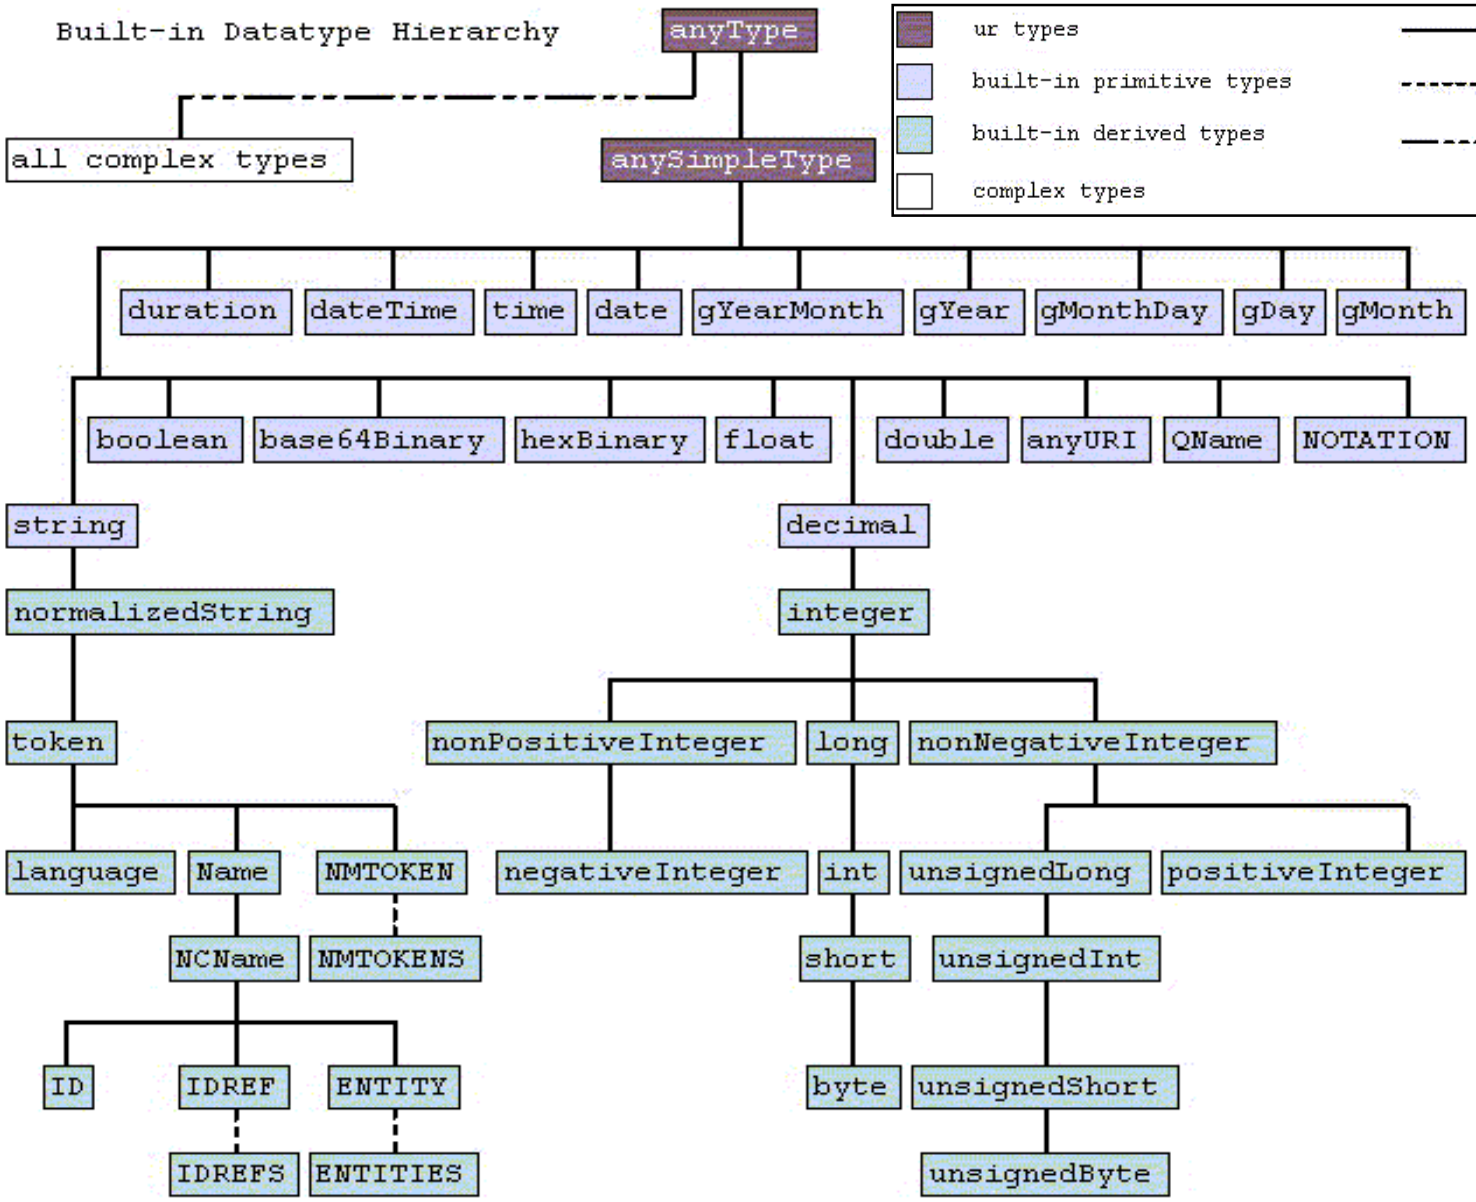
standard literals are xsd:string

type literals with datatypes from XML Schema

```
<rdf:Description rdf:about="#Fabien">
 <teaching rdf:datatype="http://www.w3.org/2001/XMLSchema#boolean">
  true</teaching>
 <birth rdf:datatype="http://www.w3.org/2001/XMLSchema#date">
  1975-07-31</birth>
</rdf:Description/>
```

```
#Fabien teaching "true"^^xsd:boolean ;
        birth "1975-07-31"^^xsd:date .
```





W3C - http://www.w3.org/TR/xmlschema-2/

XML Schema datatypes

```
<Book>
 <title xml:lang='fr'>Seigneur des anneaux</title>
 <title xml:lang='en'>Lord of the rings</title>
</Book>
```

```
<Book> title "Seigneur des anneaux"@fr ;
       title "Lord of the rings"@en .
```

literals with languages and without are disjoint

"Fabien" ≠ "Fabien"@en ≠ "Fabien"@fr

language

typing resources

using URIs to identify the types

```
<urn://~fgandon> rdf:type <http://www.inria.fr/schema#Person>
```

a resource can have several types

```
<urn://~fgandon> rdf:type <http://www.inria.fr/schema#Person>
<urn://~fgandon> rdf:type <http://www.inria.fr/schema#Researcher>
<urn://~fgandon> rdf:type <http://www.mit.edu/schema#Lecturer>
```

```
<rdf:Description rdf:about="urn://~fgandon">
 <rdf:type rdf:resource="http://www.inria.fr/schema#Person" />
 <name>Fabien</name>
</rdf:Description>
```

```
<in:Person rdf:about="urn://~fgandon">
  <name>Fabien</name>
</in:Person>
```

```
<urn://~fgandon>
 a in:Person ;
 name "Fabien" .
```

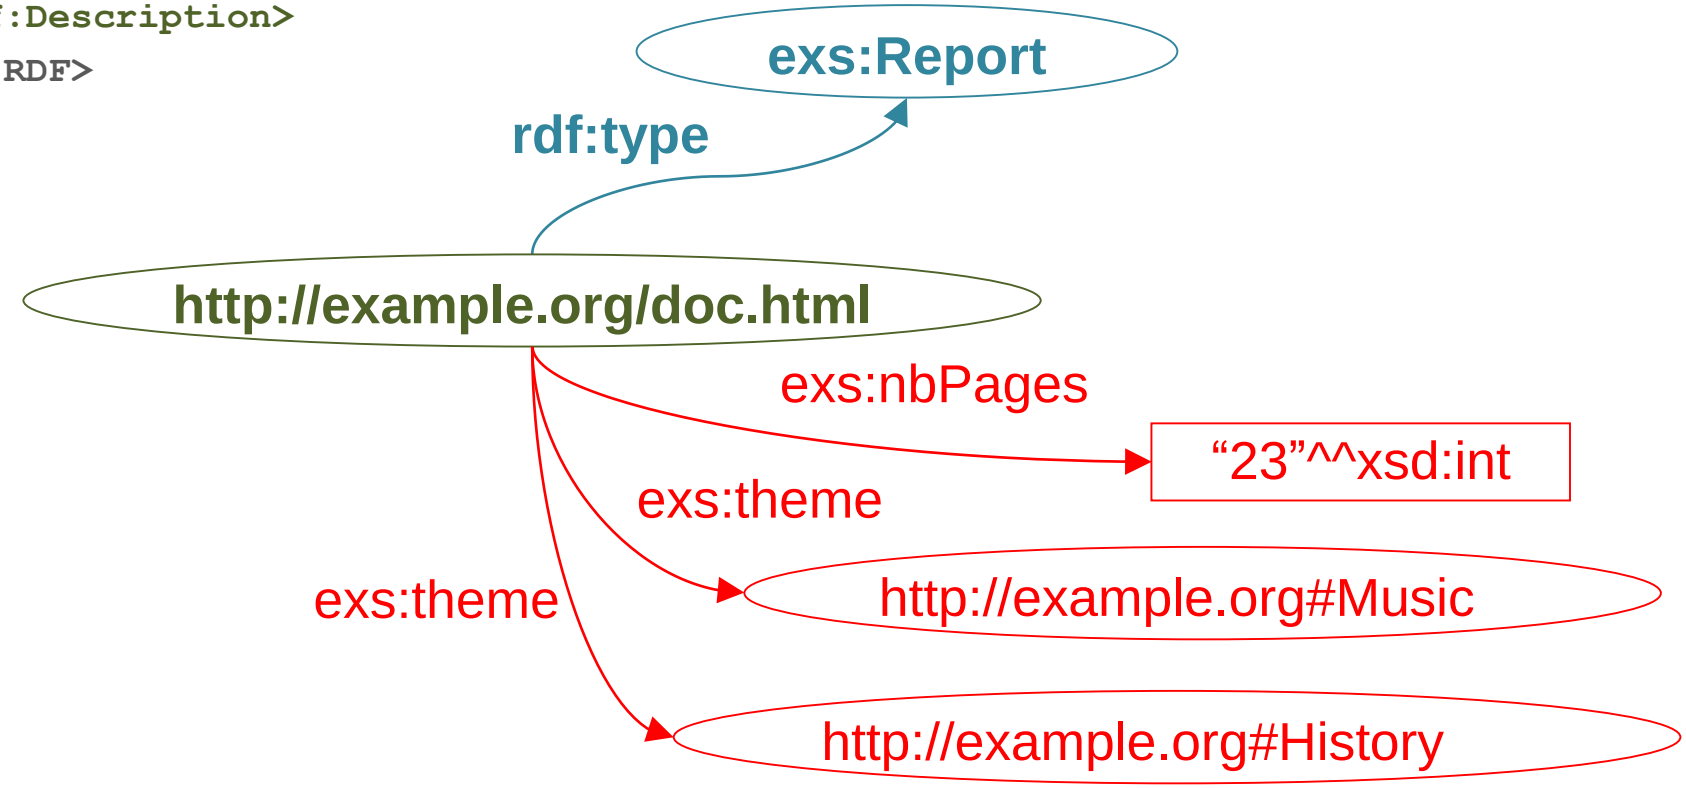
question:

```
<?xml version="1.0"?>
<rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
xmlns:exs="http://example.org/schema#">
 <rdf:Description rdf:about="http://example.org/doc.html">
  <rdf:type rdf:resource="http://example.org/schema#Report"/>
  <exs:theme rdf:resource="http://example.org#Music"/>
  <exs:theme rdf:resource="http://example.org#History"/>
  <exs:nbPages rdf:datatype="http://www.w3.org/2001/XMLSchema#int">23</exs:nbPages>
 </rdf:Description>
</rdf:RDF>
```

meaning ?

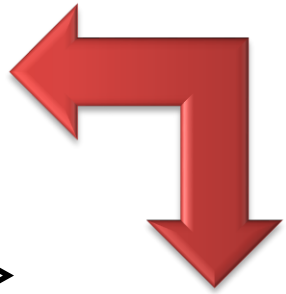
question:

```
<?xml version="1.0"?>
<rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
xmlns:exs="http://example.org/schema#">
 <rdf:Description rdf:about="http://example.org/doc.html">
  <rdf:type rdf:resource="http://example.org/schema#Report"/>
  <exs:theme rdf:resource="http://example.org#Music"/>
  <exs:theme rdf:resource="http://example.org#History"/>
  <exs:nbPages rdf:datatype="http://www.w3.org/2001/XMLSchema#int">23</exs:nbPages>
 </rdf:Description>
</rdf:RDF>
```



bags = unordered groups

```
<rdf:Description rdf:about="#">
 <author>
   <rdf:Bag>
     <rdf:li>Ivan Herman</rdf:li>
     <rdf:li>Fabien Gandon</rdf:li>
  </rdf:Bag>
 </author>
</rdf:Description>
```



```
<#> author [
 a rdf:Bag ;
 rdf:li "Ivan Herman" ;
 rdf:li "Fabien Gandon" . ] .
```

```
<#> author _:a
_:a rdf:_1 “Ivan Herman”
_:a rdf:_2 “Fabien Gandon”
```

sequence

ordered group of resources or literals

```
<rdf:Description rdf:about="#partition">
  <contains>
   <rdf:Seq>
    <rdf:li rdf:about="#C"/>
    <rdf:li rdf:about="#C"/>
    <rdf:li rdf:about="#C"/>
    <rdf:li rdf:about="#D"/>
    <rdf:li rdf:about="#E"/>
   </rdf:Seq>
  </contains>
</rdf:Description>
```

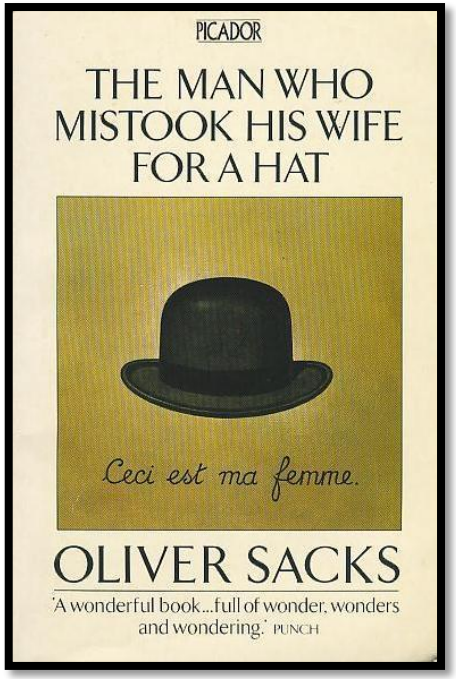
```
<partition>
 contains [
   a rdf:Seq ;
   rdf:li "C" ;
   rdf:li "C" ;
   rdf:li "C" ;
   rdf:li "D" ;
   rdf:li "E" .
] .
```

alternatives

e.g. title of a book in different languages

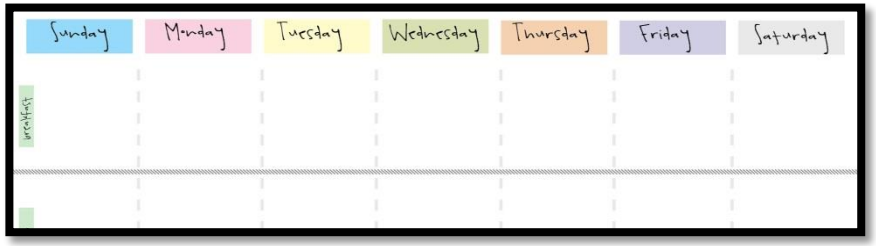
```
<rdf:Description rdf:about="#book">
  <title>
   <rdf:Alt>
    <rdf:li xml:lang="fr">l'homme qui prenait sa femme
                          pour un chapeau</rdf:li>
    <rdf:li xml:lang="en">the man who mistook his wife
                          for a hat</rdf:li>
   </rdf:Alt>
 </title>
</rdf:Description>
```

```
<#book>
 title [
  a rdf:Alt ;
  rdf:li "l'homme…"@fr ;
  rdf:li "the man…"@en .
] .
```

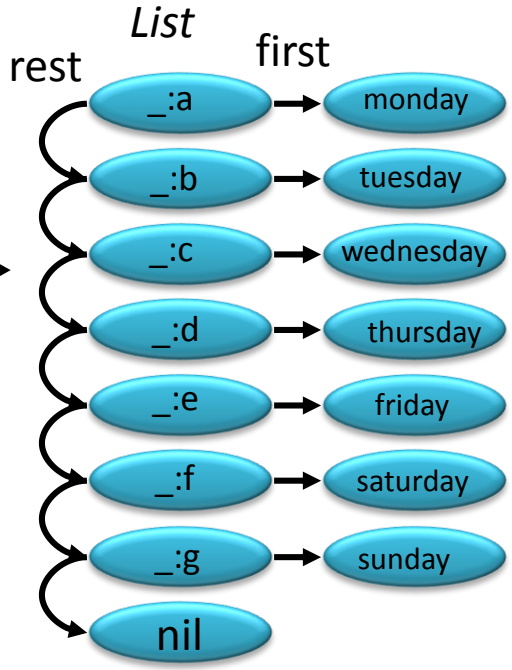


collection

exhaustive and ordered list



```
<rdf:Description rdf:about="#week">
 <dividedIn rdf:parseType="Collection">
  <rdf:Description rdf:about="#monday"/>
  <rdf:Description rdf:about="#tuesday"/>
  <rdf:Description rdf:about="#wednesday"/>
  <rdf:Description rdf:about="#thursday"/>
  <rdf:Description rdf:about="#friday"/>
  <rdf:Description rdf:about="#saturday"/>
  <rdf:Description rdf:about="#sunday"/>
 </devidedIn>
</rdf:Description>
```



```
<#week> dividedIn
 ( <#monday> <#tuesday> <#wednesday>
   <#thursday> <#friday> <#saturday> <#sunday>
  ) .
```

RDF (named) graphs

group triples in graphs named by IRIs

```
@prefix rdf:
  <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
@prefix inria: <http://inria.fr/schema#> .

GRAPH <http://inria.fr/people>
{ <http://inria.fr/rr/doc.html>
   inria:author
    <http://ns.inria.fr/fabien.gandon#me> .
}

GRAPH <http://inria.fr/topics>
{ <http://inria.fr/rr/doc.html>
 inria:theme "Music" .
}
```

TriG

```
<http://inria.fr/rr/doc.html>
 <http://inria.fr/schema#author>
   <http://ns.inria.fr/fabien.gandon#me>
    <http://inria.fr/people> .

<http://inria.fr/rr/doc.html>
 <http://inria.fr/schema#theme> "Music"
  <http://inria.fr/topics> .
```

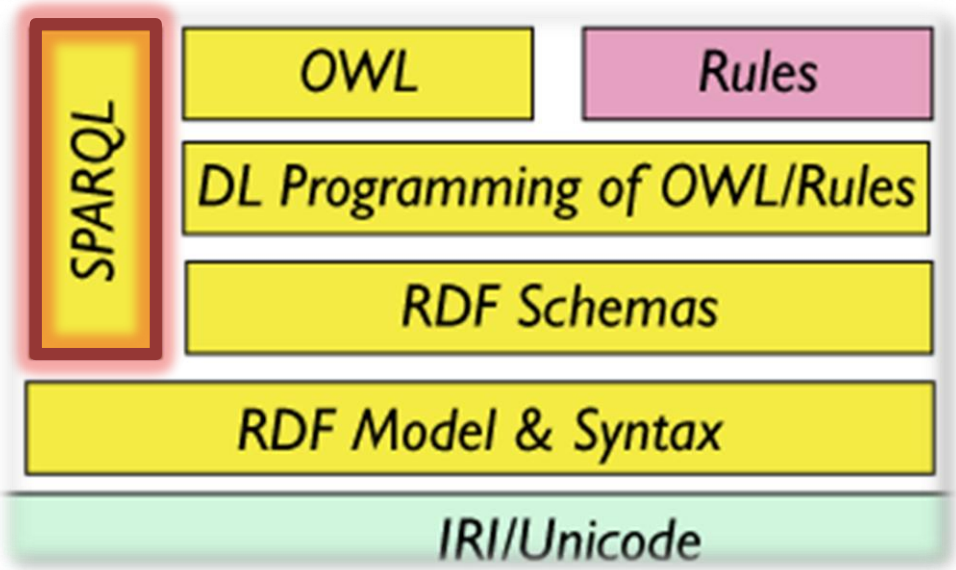
Vapsi

what is the mathematical structure of the RDF model?

query with SPARQL

SPARQL **P**rotocol and **R**DF **Q**uery **L**anguage



SPARQL in 3 parts

part 1: query language

part 2: result format

part 3: access protocol

SPARQL query

```
SELECT ...
FROM ...
WHERE { ... }
```

example

persons at least 18-year old

```
PREFIX ex: <http://inria.fr/schema#>
SELECT ?person ?name
WHERE {
  ?person rdf:type ex:Person .
  ?person ex:name ?name .
  ?person ex:age ?age .
  FILTER (?age > 17)
}
```

left(x,y) right(z,v)

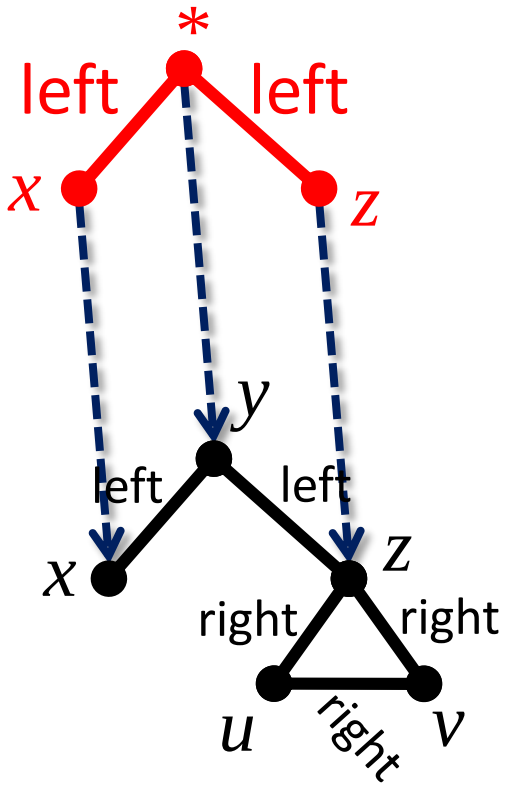
left(y,z) right(z,u)

right(u,v)

$\models$

left(x,?p) left(?p,z)

$\Leftrightarrow$



graph mapping / projection

classical three clauses:

- Select: clause to select the values to be returned
- Where: triple/graph pattern to match
- Filter: constraints expressed using test functions (XPath 2.0 or external)

SPARQL triples

- triples and question marks for variables:

```
?x rdf:type  ex:Person
```

- graph patterns to match:

```
SELECT ?subject ?proprerty ?value
WHERE {?subject ?proprerty ?value}
```

- a pattern is, by default, a conjunction of triples

```
SELECT ?x WHERE
{ ?x    rdf:type        ex:Person .
  ?x    ex:name         ?name . }
```

question:

- Query:

```
SELECT ?name WHERE {
 ?x name ?name .
 ?x email ?email .
}
```

- Base:

```
_:a name "Fabien"
_:b name "Thomas"
_:c name "Lincoln"
_:d name "Aline"
_:b email <mailto:thom@chaka.sn>
_:a email <mailto:Fabien.Gandon@inria.fr>
_:d email <mailto:avalandre@pachinko.jp>
_:a email <mailto:bafien@fabien.info>
```

x2

- Results ?

prefixes

to use namespaces:

```
PREFIX mit: <http://www.mit.edu#>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?student
WHERE {
 ?student mit:registeredAt ?x .
 ?x foaf:homepage <http://www.mit.edu> .
}
```

Base namespace : `BASE <…>`

SPARQL result

failure/ success

values found

result formats

- a binding i.e. list of all the selected values (SELECT) for each answer found;
  (stable XML format ; e.g. for XSLT transformations)
- RDF sub-graphs for each answer found
  (RDF/XML format ; e.g. for application integration)
- JSON (eg. ajax web applications)
- CSV/TSV (eg. export)

example of binding

results for previous query in XML

```
<?xml version="1.0"?>
<sparql xmlns="http://www.w3.org/2005/sparql-results#">
 <head>
  <variable name="student"/>
 </head>
 <results ordered="false" distinct="false">
  <result>
   <binding name="student">
<uri>http//www.mit.edu/data.rdf#ndieng</uri></binding>
  </result>
  <result>
   <binding name="student">
<uri>http//www.mit.edu/data.rdf#jdoe</uri></binding>
  </result>
</sparql>
```

simplified syntax

triples with a common subject:

```
SELECT ?name ?fname
WHERE {
 ?x a Person;
    name ?name ;
    firstname ?fname ;
    author ?y . }
```

```
SELECT ?name ?fname
WHERE {
 ?x rdf:type Person .
  ?x name ?name .
  ?x firstname ?fname .
  ?x author ?y .
}
```

list of values

```
?x firstname "Fabien", "Lucien" .
```

blank node

```
[firstname "Fabien"] or [] firstname "Fabien"
```

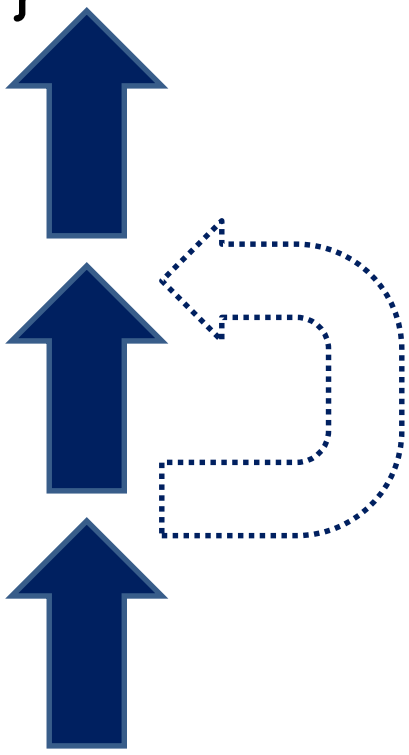
source

```
PREFIX mit: <http://www.mit.edu#>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
FROM http//www.mit.edu/data.rdf
SELECT ?student
WHERE {
 ?student mit:registeredAt ?x .
 ?x foaf:homepage <http://www.mit.edu> .
}
```

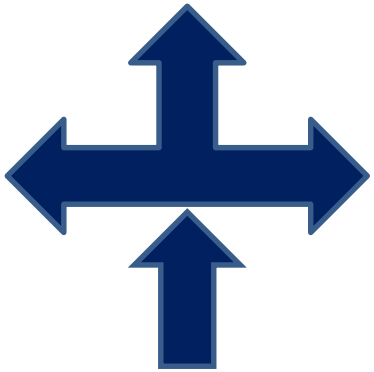
optional part

```
PREFIX mit: <http://www.mit.edu#>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?student ?name
WHERE {
 ?student mit:registeredAt ?x .
 ?x foaf:homepage <http://www.mit.edu> .
 OPTIONAL {? student foaf:name ?name . }
}
```

possibly unbound



union



alternative graph patterns

```
PREFIX mit: <http://www.mit.edu#>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?student ?name
WHERE {
  ?student mit:registeredAt ?x .
  {
    {
     ?x foaf:homepage <http://www.mit.edu> .
    }
    UNION
    {
     ?x foaf:homepage <www.stanford.edu/> .
    }
  }
}
```

what are the results of this query on this base?

```
SELECT ?name WHERE {
 ?x :name ?name ;
    :email ?email .
}
```

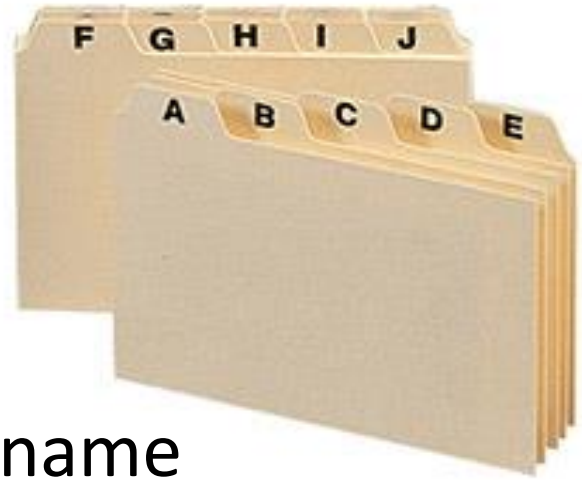
query

```
_:a :name "Fabien"
_:b :name "Thomas"
_:c :name "Lincoln"
_:d :name "Aline"
_:b :email <mailto:thom@chaka.sn>
_:a :email <mailto:Fabien.Gandon@inria.fr>
_:d :email <mailto:avalandre@pachinko.jp>
_:a :email <mailto:bafien@fabien.info>
```

base

sort, filter and limit answers

```
PREFIX mit: <http://www.mit.edu#>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?student ?name
WHERE {
  ?student mit:registeredAt ?x .
  ?x foaf:homepage <http://www.mit.edu> .
  ?student foaf:name ?name .
  ? student foaf:age ?age .
  FILTER (?age > 22)
}
ORDER BY ?name
LIMIT 20
OFFSET 20
```



students older than 22 years sorted by name
results from number #21 to #40

operators

- Inside the FILTER:
  - Comparators: **`<, >, =, <=, >=,  !=`**
  - Tests on variables : **`isURI(?x), isBlank(?x), isLiteral(?x), bound(?x)`**
  - Regular expression **`regex(?x, "A.*")`**
  - Attributes and values: **`lang(), datatype(), str()`**
  - Casting: **`xsd:integer(?x)`**
  - External functions and extensions
  - Boolean combinations: **`&&, ||`**
- In the where WHERE: **`@fr , ^^xsd:integer`**
- In the SELECT: **`distinct`**

other functions (v 1.1)

`isNumeric(Val)` test it is a numeric value

`coalesce(val,…, val)` first valid value

`IRI(Str)/URI(Str)` to build an iri/uri from a string

`BNODE(ID)` to build a blank node

`RAND()` random value between 0 and 1

`ABS(Val)` absolute value

`CEIL(Val), FLOOR(Val), ROUND(Val)`

`NOW()` today's date

`DAY(Date), HOURS(Date), MINUTES(Date), MONTH(Date), SECONDS(Date), TIMEZONE(Date), TZ(Date), YEAR(Date)`
to access different parts of a date

`MD5(Val), SHA1(Val), SHA256(Val), SHA384(Val), SHA512(Val)` hash functions

string / literal functions (v1.1)

`STRDT(value, type)` build a typed literal

`STRLANG(value, lang)` build a literal with a language

`CONCAT(lit1,…,litn)` concatenate a list of literal

`CONTAINS(lit1,lit2)`, `STRSTARTS(lit1,lit2)`, `STRENDS(lit1,lit2)`

to test string inclusion

`SUBSTR(lit, start [,length])` extract a sub string

`ENCODE_FOR_URI (Str)` encodes a string as URI

`UCASE (Str)`, `LCASE (Str)` uppercase and lowercase

`STRLEN (Str)` length of the string

Aggregates

`group by` + `count`, `sum`, `min`, `max`, `avg`, `group_concat`, or **`sample`**

ex. average scores, grouped by the subject, but only where the mean is greater than 10

```
SELECT (AVG(?score) AS ?average)
WHERE { ?student score ?score . }
GROUP BY ?student
HAVING(AVG(?score) > 10)
```

question:

```
PREFIX ex: <http://www.exemple.abc#>
SELECT ?person
WHERE {
   ?person rdf:type ?type .
   FILTER(! ( ?type = ex:Man ))
}
```

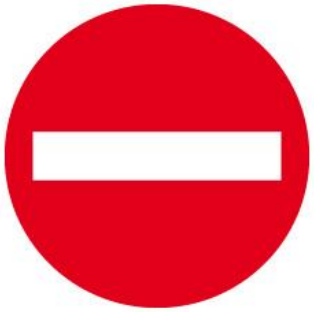
minus

substract a pattern

```
PREFIX ex: <http://www.exemple.abc#>
SELECT ?person
WHERE {
  { ?x rdf:type ex:Person }
   minus {?x rdf:type ex:Man}
}
```

not exist

check the absence of a pattern



```
PREFIX ex: <http://www.exemple.abc#>
SELECT ?person
WHERE {
  ?x ex:memberOf ?org .
  filter (not exists
    {?y ex:memberOf <Hell>})
}
```

if… then… else

```
prefix foaf: <http://xmlns.com/foaf/0.1/>
select * where {
 ?x foaf:name ?name ; foaf:age ?age .
 filter (
  if (langMatches( lang(?name), "FR"),
     ?age>=18, ?age>=21) )
}
```

test a value is `in` / `not in` a list

```
prefix foaf: <http://xmlns.com/foaf/0.1/>
select * where {
     ?x foaf:name ?n .
     filter (?n in ("fabien", "olivier",
                    "catherine") )
}
```

values

pre-defined bindings

```
select ?person where {
  ?person name ?name .
  VALUES (?name)
    { "Peter" "Pedro" "Pierre" }
}
```

paths

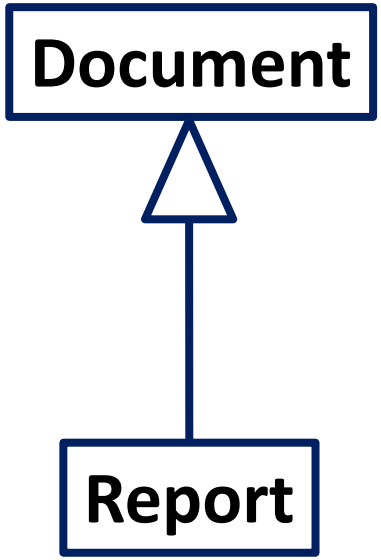
PUBLISH SEMANTICS OF SCHEMAS

W3C®

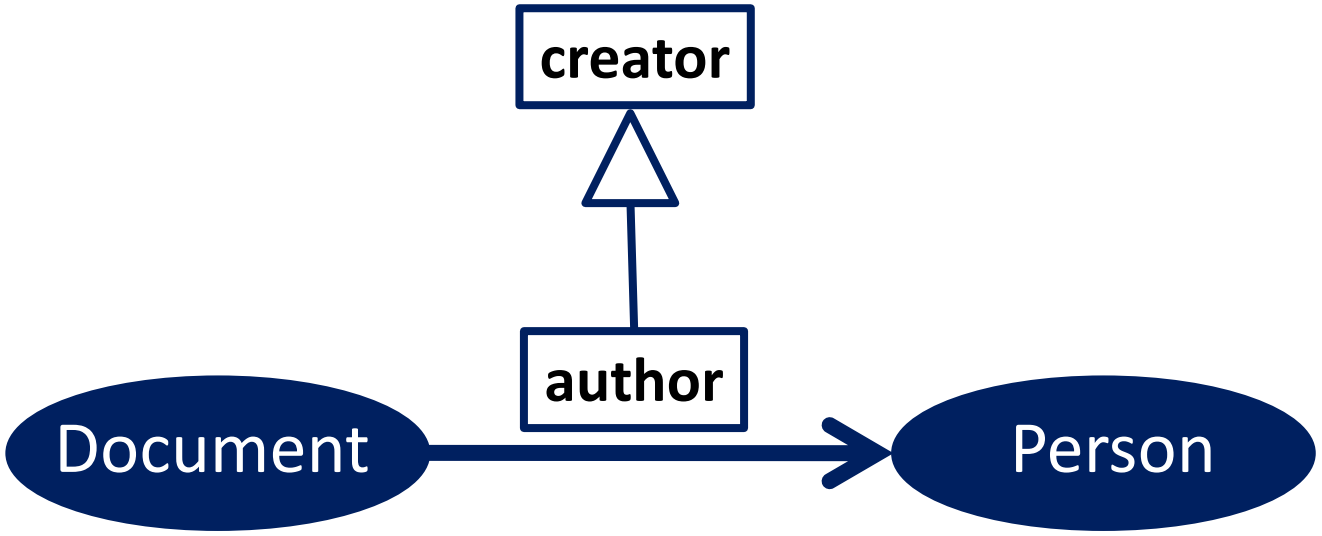
RDFS means RDF Schema

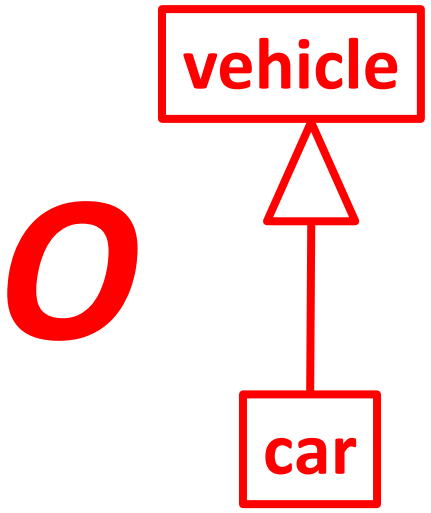
RDFS provides primitives to *W*rite lightweight ontologies

RDFS to define classes of resources and organize their hierarchy

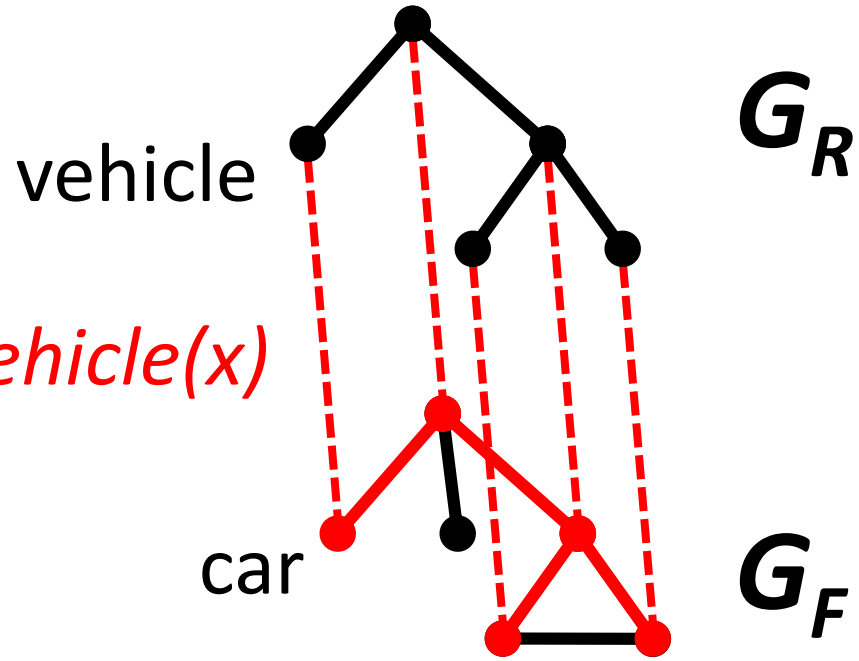


RDFS to define relations between resources, their signature and organize their hierarchy



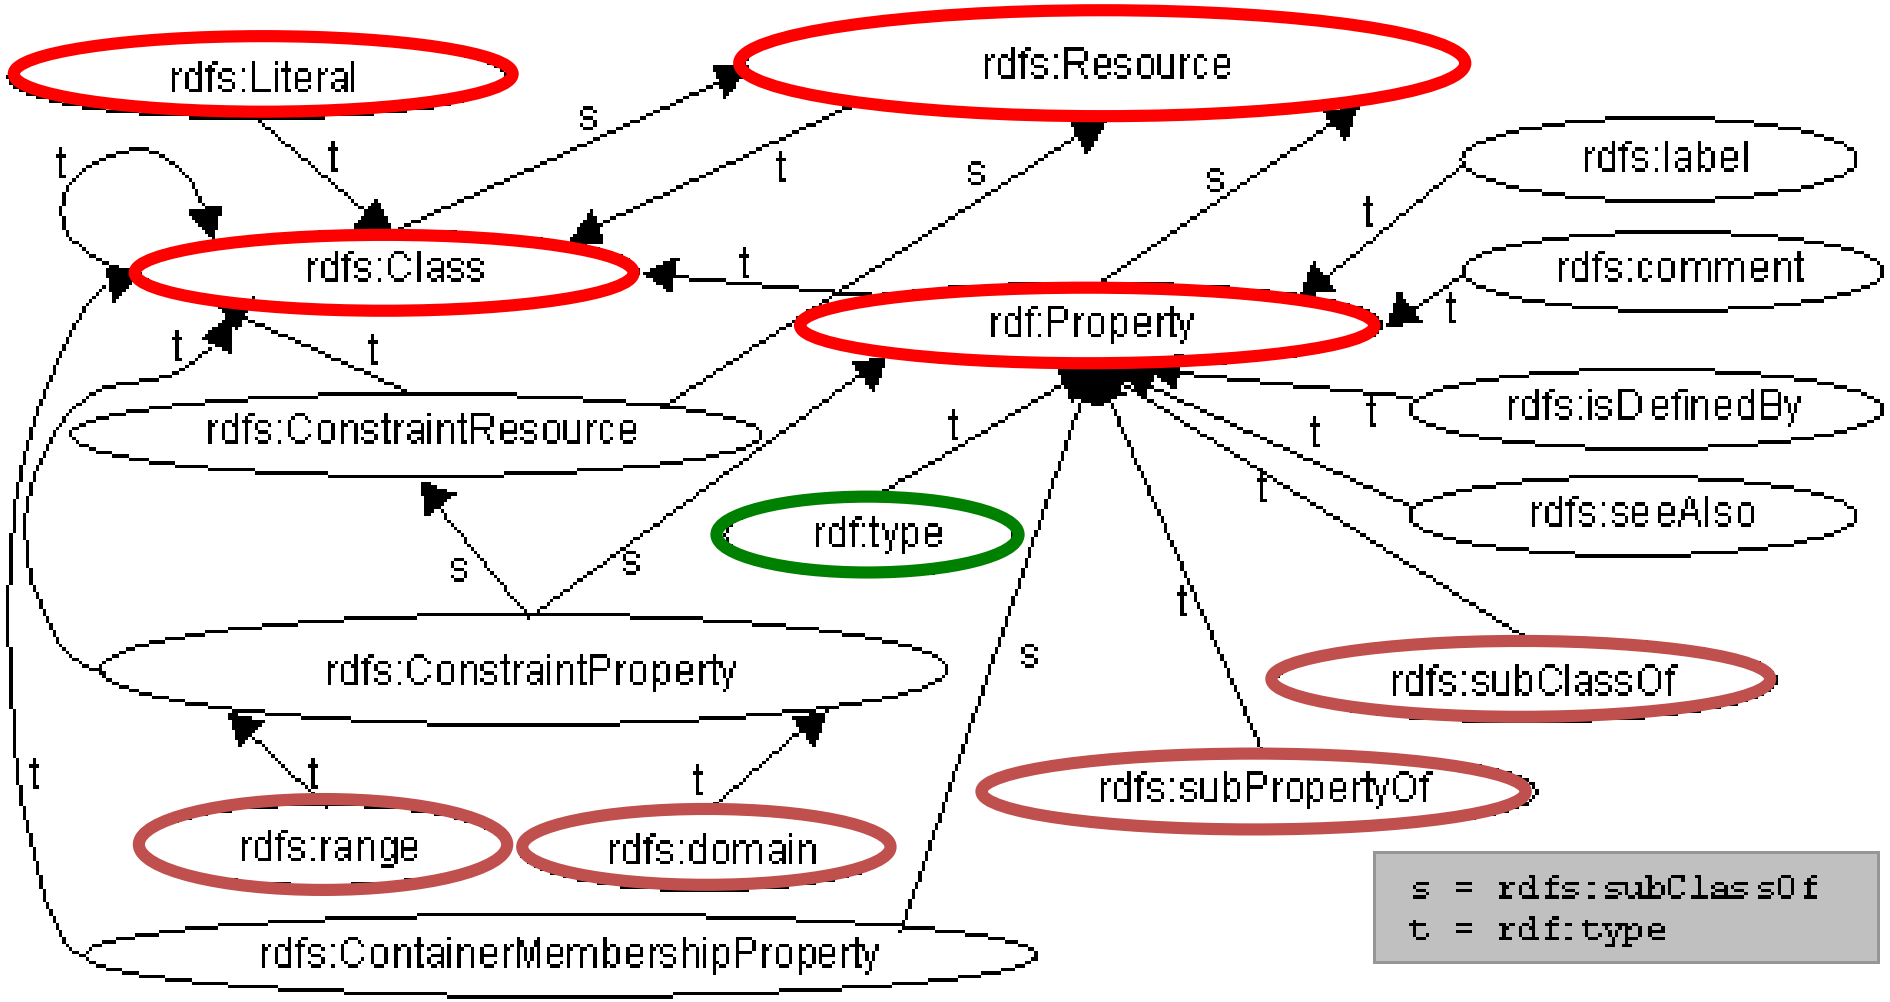


car(x)⇒vehicle(x)



$$F \wedge O \rightarrow R \Leftrightarrow G_F \leq G_R$$

mapping modulo an ontology



an old schema of RDFS

W3C http://www.w3.org/TR/2000/CR-rdf-schema-20000327/

example of RDFS schema

```
<rdf:RDF xml:base  ="http://inria.fr/2005/humans.rdfs"
 xmlns:rdf ="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
 xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
 xmlns     ="http://www.w3.org/2000/01/rdf-schema#>
 <Class rdf:ID="Man">
  <subClassOf rdf:resource="#Person"/>
  <subClassOf rdf:resource="#Male"/>
   <label xml:lang="en">man</label>
   <comment xml:lang="en">an adult male person</comment>
 </Class>
```

<Man> a Class ; subClassOf <Person>, <Male> .

example of RDFS properties

```
<rdf:RDF xml:base  ="http://inria.fr/2005/humans.rdfs"
 xmlns:rdf ="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
 xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
 xmlns     ="http://www.w3.org/2000/01/rdf-schema#>
 <rdf:Property rdf:ID="hasMother">
   <subPropertyOf rdf:resource="#hasParent"/>
   <range rdf:resource="#Female"/>
   <domain rdf:resource="#Human"/>
   <label xml:lang="en">has for mother</label>
   <comment xml:lang="en">to have for parent a female.
                                                  </comment>
 </rdf:Property>
```

```
<hasMother> a rdf:Property ;
  subPropertyOf <hasParent> ;
  range <Female> ; domain <Human> .
```

```
<rdf:RDF xmlns:rdf ="http://www.w3.org/1999/02/22-rdf-
   syntax-ns#"
   xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#"
   xmlns="http://inria.fr/2005/humans.rdfs#"
   xml:base=" http://inria.fr/2005/humans.rdfs-instances" >

   <rdf:Description rdf:ID="Lucas">
      <rdf:type
   rdf:resource="http://inria.fr/2005/humans.rdfs#Man"/>
      <hasMother rdf:resource="#Laura"/>
   </rdf:Description>

   <Man rdf:ID="Lucas">
      <hasMother rdf:resource="#Laura"/>
   </Man>
```

```
<Luca> a Man; hasMother <Laura> .
```

example of RDF using this schema

rdfs:label

a resource may have one or more labels in one or more natural language

```
<rdf:Property rdf:ID='name'>
 <rdfs:domain rdf:resource='Person'/>
 <rdfs:range rdf:resource='&rdfs;Literal'/>
 <rdfs:label xml:lang='fr'>nom</rdfs:label>
 <rdfs:label xml:lang='fr'>nom de famille</rdfs:label>
 <rdfs:label xml:lang='en'>name</rdfs:label>
</rdf:Property>
```

```
<name> a rdf:Property ;
   range rdfs:Literal ; domain <Person> ;
   label "nom"@fr, "nom de famille"@fr, "name"@en .
```

rdfs:comment & rdfs:seeAlso

comments provide definitions and explanations in natural language

```
<rdfs:Class rdf:about='#Woman'>
  <rdfs:subClassOf rdf:resource="#Person"/>
  <rdfs:comment xml:lang='fr'>une personne adulte du
                              sexe féminin</rdfs:comment>
  <rdfs:comment xml:lang='en'>a female adult person
  </rdfs:comment>
</rdfs:Class>
```

```
<Woman> a rdfs:Class ; rdfs:subClassOf <Person> ;
  rdfs:comment "adult femal person"@en ;
  rdfs:comment "une adulte de sexe féminin"@fr .
```

see also…

```
<rdfs:Class rdf:about='#Man'>
    <rdfs:seeAlso rdf:resource='#Woman'/>
</rdfs:Class>
```

```
<Man> a rdfs:Class ; rdfs:seeAlso <Woman> .
```

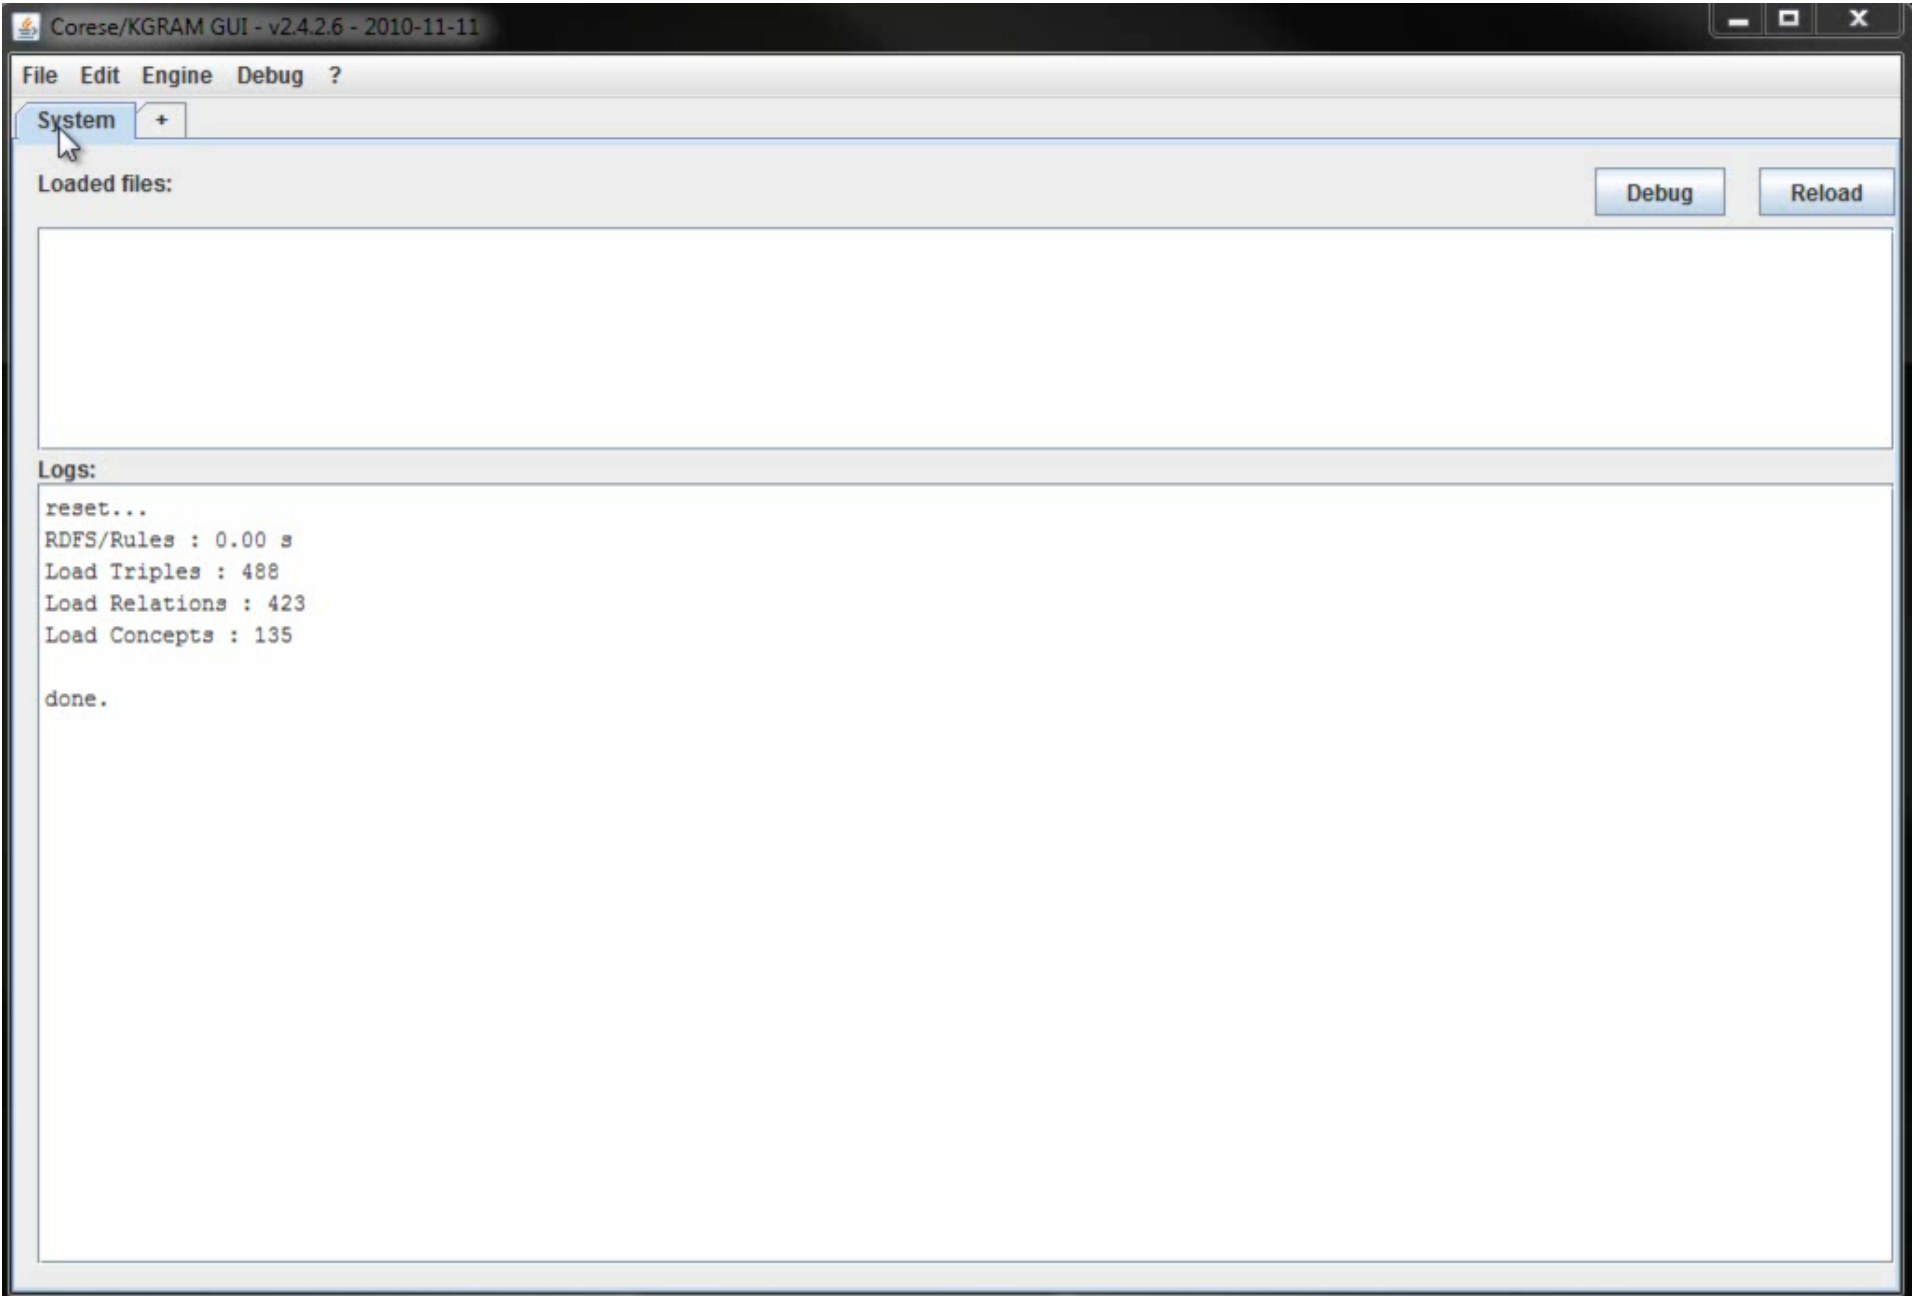
What are we defining here?

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
@base <http://inria.fr/2005/humans.rdfs>
<B> rdfs:subClassOf <A> .

<C> rdfs:subClassOf <A> .

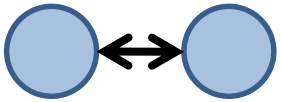
<P> rdfs:domain <B> ;  rdfs:range  <C> .
```

CORESE/ KGRAM

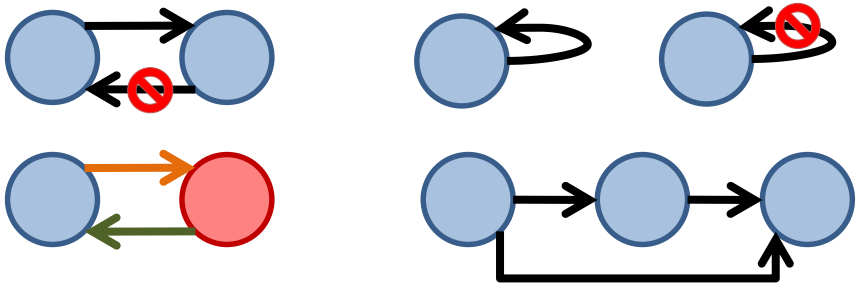


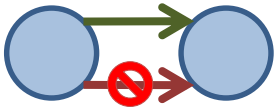
OWL provides **additional primitives** for heavyweight ontologies

OWL in one…

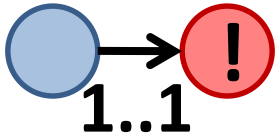


algebraic properties

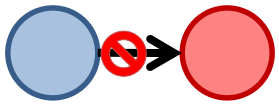




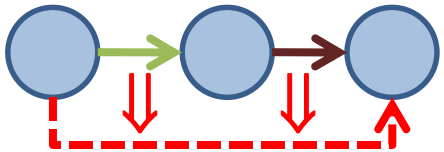
disjoint properties



qualified cardinality

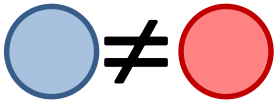


individual prop. neg

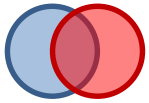


chained prop.

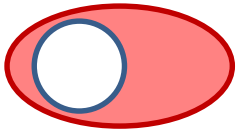
union



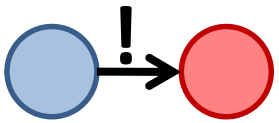
disjunction



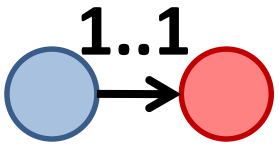
intersection



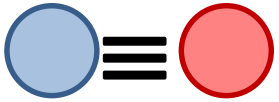
complement



restriction

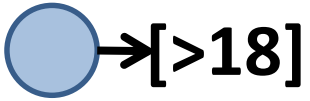


cardinality

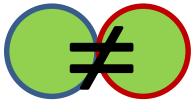


equivalence

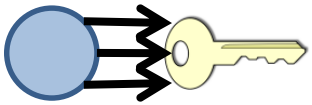
enumeration



value restrict.



disjoint union



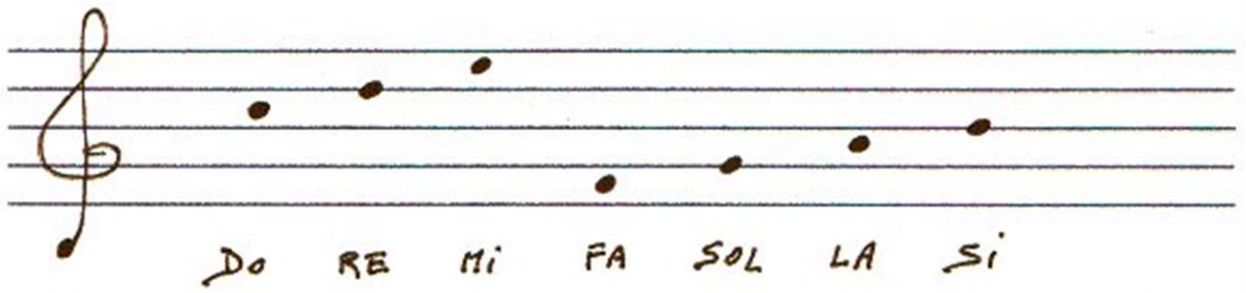
keys

…

enumerated class {a,b,c,d,e}

define a class by providing all its members

```
<owl:Class rdf:id="EyeColor">
    <owl:oneOf rdf:parseType="Collection">
      <owl:Thing rdf:ID="Blue"/>
      <owl:Thing rdf:ID="Green"/>
      <owl:Thing rdf:ID="Brown"/>
      <owl:Thing rdf:ID="Black"/>
    </owl:oneOf>
</owl:Class>
```

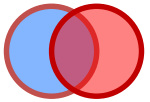


classes defined by union

of other classes

```
<owl:Class>
    <owl:unionOf rdf:parseType="Collection">
        <owl:Class rdf:about="#Person"/>
        <owl:Class rdf:about="#Group"/>
  </owl:unionOf>
</owl:Class>
```

classes defined by intersection



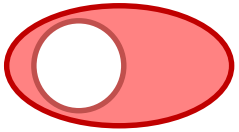
of other classes

```
<owl:Class rdf:ID="Man">
  <owl:intersectionOf rdf:parseType="Collection">
   <owl:Class rdf:about="#Male"/>
   <owl:Class rdf:about="#Person"/>
  </owl:intersectionOf>
</owl:Class>
```

complement and disjunction

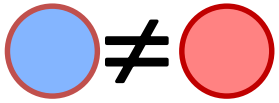
complement class

```
<owl:Class rdf:ID="Male">
   <owl:complementOf rdf:resource="#Female"/>
</owl:Class>
```

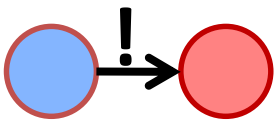


declare a disjunction

```
<owl:Class rdf:ID="Square">
  <owl:disjointWith rdf:resource="#Round"/>
</owl:Class>
```

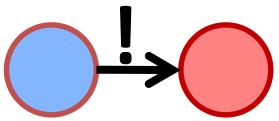


restriction on all values



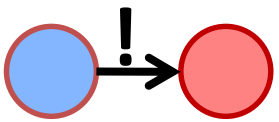
```
<owl:Class rdf:ID="Herbivore">
  <subClassOf rdf:resource="#Animal"/>
  <subClassOf>
   <owl:Restriction>
    <owl:onProperty rdf:resource="#eats" />
    <owl:allValuesFrom rdf:resource="#Plant" />
   </owl:Restriction>
  </subClassOf>
</owl:Class>
```

restriction on some values



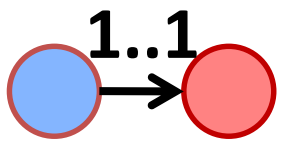
```
<owl:Class rdf:ID="Sportive">
 <owl:equivalentClass>
  <owl:Restriction>
   <owl:onProperty rdf:resource="#hobby" />
   <owl:someValuesFrom rdf:resource="#Sport" />
  </owl:Restriction>
 </owl:equivalentClass>
</owl:Class>
```

restriction to an exact value



```
<owl:Class rdf:ID="Bike">
 <subClassOf>
   <owl:Restriction>
    <owl:onProperty rdf:resource="#nbWheels" />
    <owl:hasValue>2</owl:hasValue>
   </owl:Restriction>
 </subClassOf>
</owl:Class>
```

restriction on cardinality



how many times a property is used for
a same subject but with different values

- Constraints: minimum, maximum, exact number
- Exemple

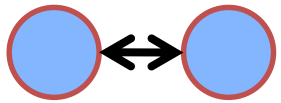
```
<owl:Class rdf:ID="Person">
 <subClassOf>
  <owl:Restriction>
   <owl:onProperty rdf:resource="#name" />
   <owl:maxCardinality>1</owl:maxCardinality>
  </owl:Restriction>
 </subClassOf>
</owl:Class>
```

types of properties

- `ObjectProperty` are relations between resources only
  e.g. hasParent(#thomas,#stephan)
- `DatatypeProperty` have a literal value possibly typed
  ex:hasAge(#thomas,16^^xsd:int)
- `AnnotationProperty` are ignored in inferences and used for documentation and extensions

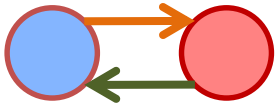
algebraic properties

- Symmetric property, xRy ⇒ yRx



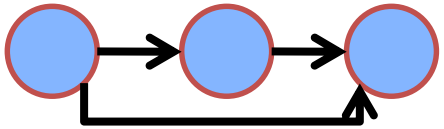
```
<owl:SymmetricProperty rdf:ID="hasSpouse" />
```

- Inverse property, $xR_1y \Leftrightarrow yR_2x$



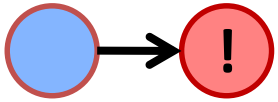
```
<rdf:Property rdf:ID="hasChild">
  <owl:inverseOf rdf:resource="#hasParent"/>
</rdf:Property>
```

- Transitive property, xRy & yRz ⇒ xRz



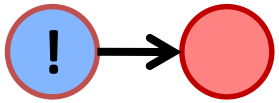
```
<owl:TransitiveProperty rdf:ID="hasAncestor" />
```

- Functional property, xRy & xRz ⇒ y=z



```
<owl:FunctionalProperty rdf:ID="hasMother" />
```

- Inverse functional property, xRy & zRy ⇒ x=z



```
<owl:InverseFunctionalProperty
rdf:ID="hasSocialSecurityNumber" />
```

equivalencies and alignment

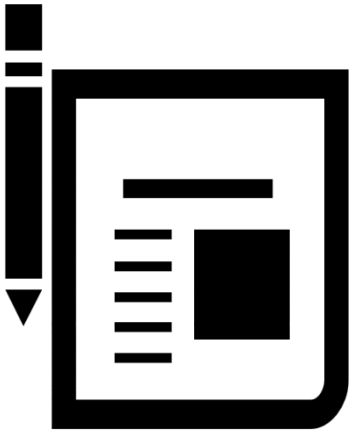
- equivalent classes : `owl:equivalentClass`
- equivalent properties: `owl:equivalentProperty`
- identical or different resources:

  `owl:sameAs`, `owl:differentFrom`

document the schemas

description of the ontology

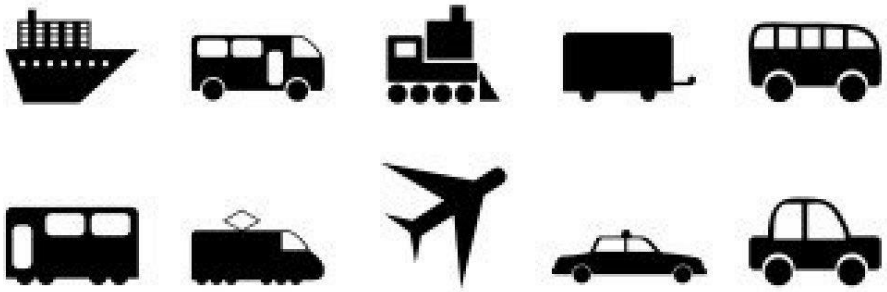
`owl:Ontology, owl:imports, owl:versionInfo, owl:priorVersion, owl:backwardCompatibleWith, owl:incompatibleWith`



versions of classes and properties

`owl:DeprecatedClass, owl:DeprecatedProperty`

OWL profiles



EL: large numbers of properties and/or classes and polynomial time.

QL: large volumes of instance data, and conjunctive query answering using conventional relational database in LOGSPACE

RL: scalable reasoning without sacrificing too much expressive power using rule-based reasoning in polynomial time

What are we defining here?

```
<A> owl:equivalentClass
 [  owl:intersectionOf ( <B> <C> )  ] .
```

Linked Open Vocabularies (LOV)

developped by Pierre-Yves Vandenbussche

Welcome to LOV, your entry point to the growing ecosystem of linked open vocabularies (RDFS or OWL ontologies) used in the Linked Data Cloud. Here you will find vocabularies listed and individually described by metadata, classified by vocabulary spaces, interlinked using the dedicated vocabulary VOAF.
You will enjoy querying the LOV dataset either at vocabulary level or at element level, exploring the vocabulary content using full-text faceted search, and finding metrics about the use of vocabularies in the Semantic Web.
Not finding your favourite one? Suggest a new vocabulary to add to LOV!

Help us and suggest a new vocabulary !

Vocabulary spaces (285):

Classifying vocabularies is a brand new challenge for Library Science, and no existing classification scheme seems to fit the need so far. Unless we missed something, and in that case we are open to suggestions from the librarian community.

Semantic Web Development Tools

Overview

This Wiki contains a collection of tool references that can help in developing Semantic Web applications. These include complete development environments, editors, libraries or modules for various programming languages, specialized browsers, etc. The goal is to list such tools and *not* Semantic Web applications in general (the interested reader may consider looking at the W3C SW Use Case Collection for those.)

The tool content of this wiki is still to be maintained by the community and not by the W3C staff. If you are interested in adding to and/or modifying the relevant pages, please consult the separate Tool Contributors' page.

http://www.w3.org/2001/sw/wiki/Tools
