

# SAME 2009 Forum

## Keynote Speaker

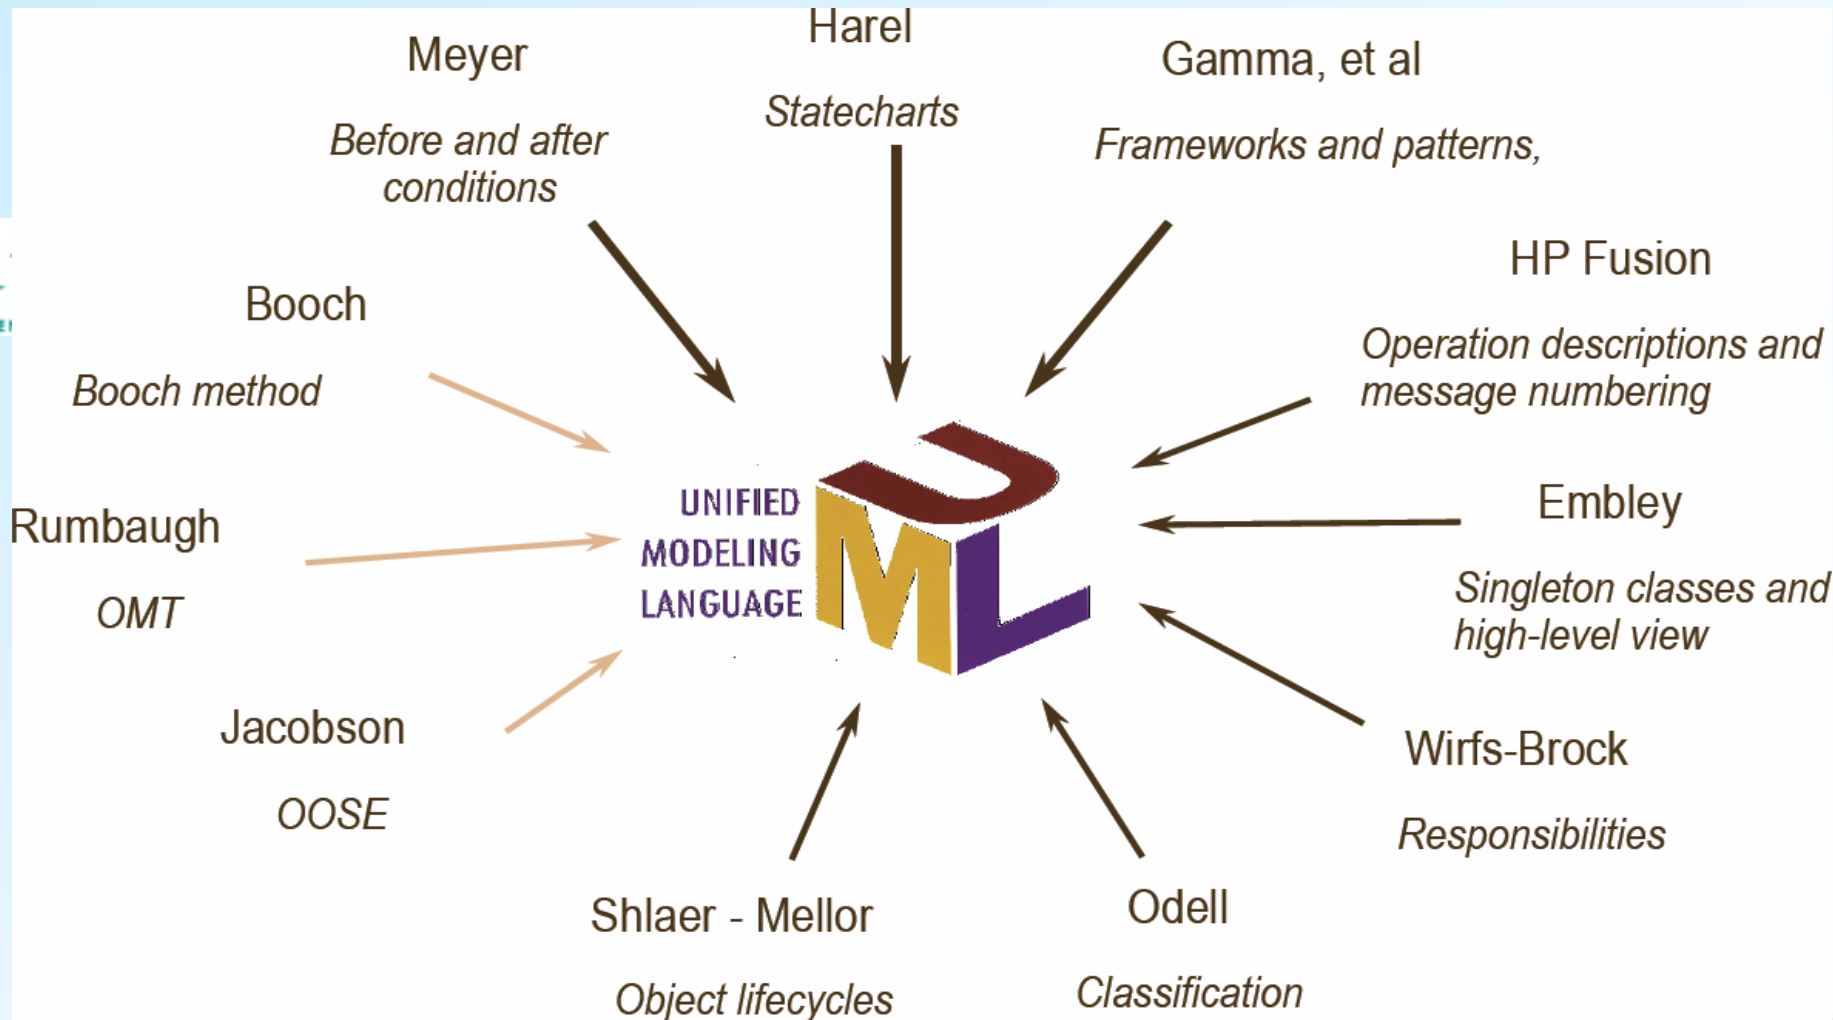

# MARTE: The OMG UML2 Profile for Modeling and Analysis of Real-Time and Embedded systems

Frédéric Mallet

Aoste Team-project – INRIA/I3S

Université de Nice Sophia Antipolis

# Unified Modeling Language (UML)

# Domain-specific profiles

## □ Advantages of using UML profiles

- Reuse of language infrastructure (tools, specifications)
- Reduce training time of engineers
- Allow for new (graphical) notation of extended stereotypes
- A profile can define model viewpoints
  - E.g., UML activity diagram extended to specify multitask behavior

## □ Disadvantages

- Constrained by the UML metamodel
- 'light-weight' extensions

# Profiles and stereotypes

## □ Profiles

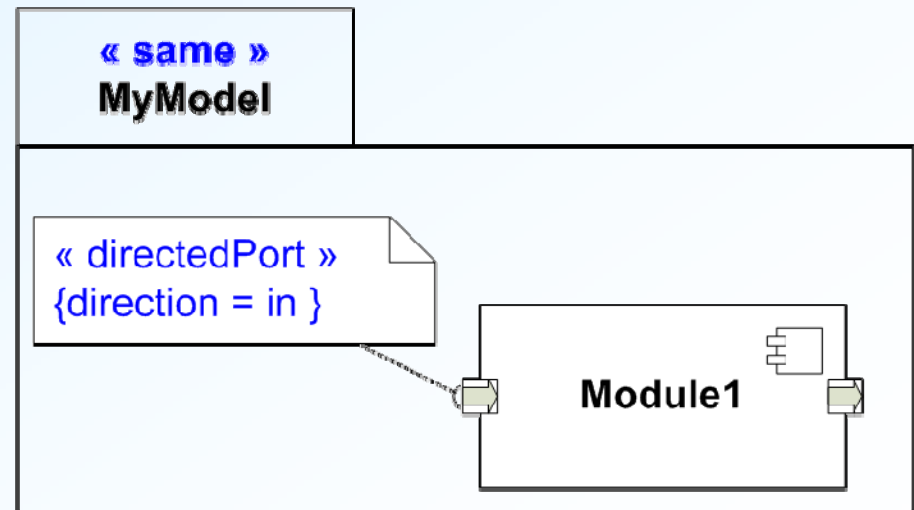

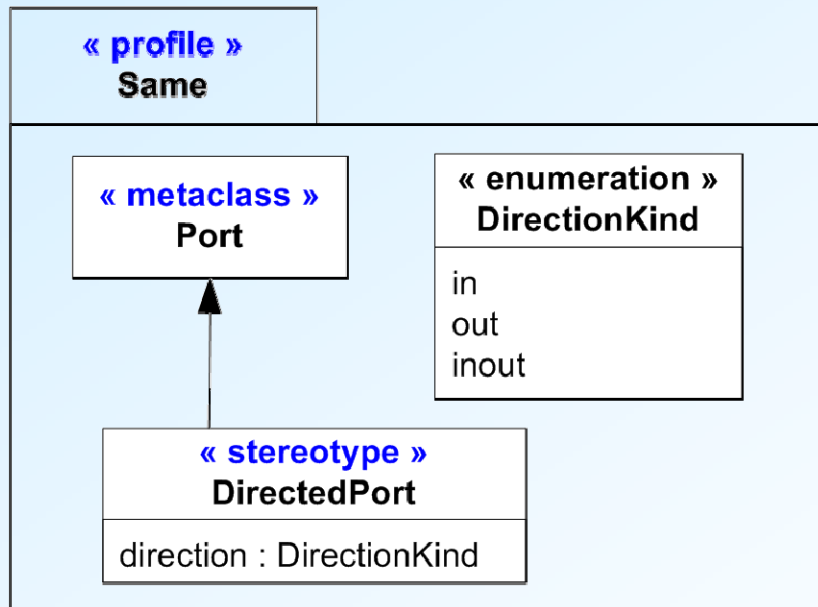

- Extend a metamodel for a specific platform or domain
- Consist of stereotypes that extend the metamodel classes

## □ Stereotypes

- Introduce platform-specific **terminology/syntax/notation**
  - E.g., IP or VC instead of Class/Component
  - E.g., Use an icon for a processor instead of a generic node
- Provide **additional semantics**, but only for
  - Semantic restriction or clarification of existing concepts
  - New features (but compatible with existing ones !)
  - E.g., what happens with simultaneous events

# Defining a stereotype: DirectedPort

- The **stereotype DirectedPort** refers to a **Port**
- It has only one **property**
  - The **direction**, whose type is specified by an Enumeration

# SPT - Schedulability, Performance & Time

- ❑ **SPT was the first OMG UML profile for Real-Time Systems**
  - RMA-like Schedulability Analysis
  - Performance Analysis with Queueing Theory and Petri Nets
  - A model for “metric” Time and Time Mechanisms
  
- ❑ **Several improvements required**
  - Modeling HW and SW platforms, Logical Time, MoCCs
  - Alignment to UML2 (Simple Time), QoS&FT
  - SPT was considered too abstract and hard to apply

Hence, a Request For Proposal for a new profile was issued in 2005.

# The ProMARTE Team

## ❑ Industrials

- Alcatel\*
- Lockheed Martin\*
- Thales\*
- France-Telecom

## ❑ Tool vendors

- ARTISAN Software Tools\*
- International Business Machines\*
- Mentor Graphics Corporation\*
- Softeam\*
- Telelogic AB (I-Logix\*)
- Tri-Pacific Software
- France Telecom
- No Magic
- Mathworks

## ❑ Academics

- Carleton University
- Commissariat à l'Energie Atomique
- ESEO
- ENSIETA
- INRIA
- INSA from Lyon
- Software Engineering Institute (Carnegie Mellon University)
- Universidad de Cantabria

## ❑ Public website

[www.omgmarte.org](http://www.omgmarte.org)

# Relationships with other OMG Standards

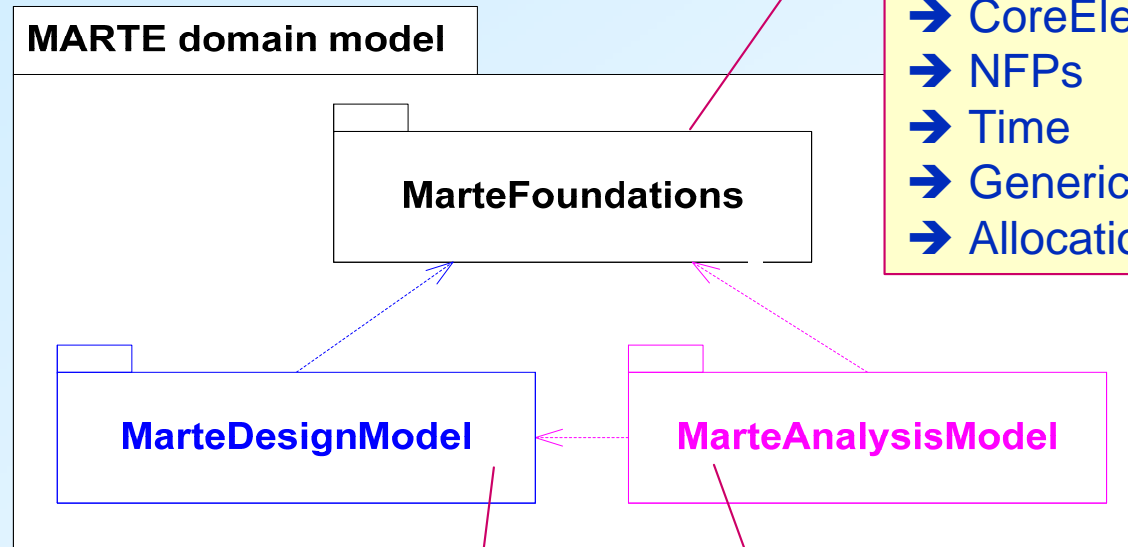

- Relationships with generic OMG standards
  - **Extends** the UML2 superstructure meta-model
  - **Supersedes** UML Profile for SPT (Scheduling, Performance and Time)
  - **Uses** OCL2 (Object Constraint Language)
  - **Complements** the UML profile for Systems Engineering (SysML)
    - Specialization of SysML allocation concepts
    - Overlap of team members

# Relationships with other OMG Standards

- Relationships with RT&E specific OMG standards
  - The UML profile for Modeling QoS and FT Characteristics and Mechanisms
    - Partially **covered by** MARTE NFP package
  - The UML profile for SoC (System On Chip)
    - **More specific** than MARTE purpose
  - The Real-Time CORBA profile
    - Real-Time CORBA based architecture can be annotated for analysis with MARTE

# MARTE Overview

## Foundations for RT/E systems modeling and analysis

- CoreElements
- NFPs
- Time
- Generic resource modeling
- Allocation

## Specification and Design

- High-Level application modeling
- Generic component modeling
- Software resource modeling
- Hardware resource modeling

## Analysis

- Generic quantitative analysis
- Schedulability analysis
- Performance analysis

# Non-Functional Properties (NFP)

Includes VSL  
(Value Specification Language)

# Non-Functional Properties

(E.g., performance, memory usage, power consumption)

- ❑ Nature of NFPs
  - Quantitative: magnitude + **unit** (E.g., energy, data size, duration)
    - Quantity-Unit-Dimension for dimensional analysis (from IEEE)
  - Qualitative (E.g., periodic or sporadic event arrival patterns)
- ❑ NFP values are qualified (required/provided/measured/estimated)
- ❑ NFP introduces variables and expressions
- ❑ NFPs have a precise syntax: ANTLR parser
  - Predefined NFPs (E.g., end-to-end latency, processor utilization)
  - User-specific NFPs (Parser generated by introspection)

# Where to use NFP values ?

- Two kinds of non-function properties
  - Predefined stereotype properties
  - User-defined properties

« hwRAM » 

**K4S641632H : SDRAM**

{frequency = 166 **MHz**,  
memorySize = 64 **MB**,  
addressSize = 22 **bit**,  
organization = {4096, 256, 4, 16 **bit**},  
timings = {{('tCAS', 'CAS latency', 2 **CLK**),  
('tRAS', 'row active time', 18 **ns**)}}

burstLengths = 1, 2, 4, 8  
burstTypes = sequential, interleave  
refreshRate = (4 **Kcycles**, 64 **ms**)  
refreshModes = CAS#beforeRAS#

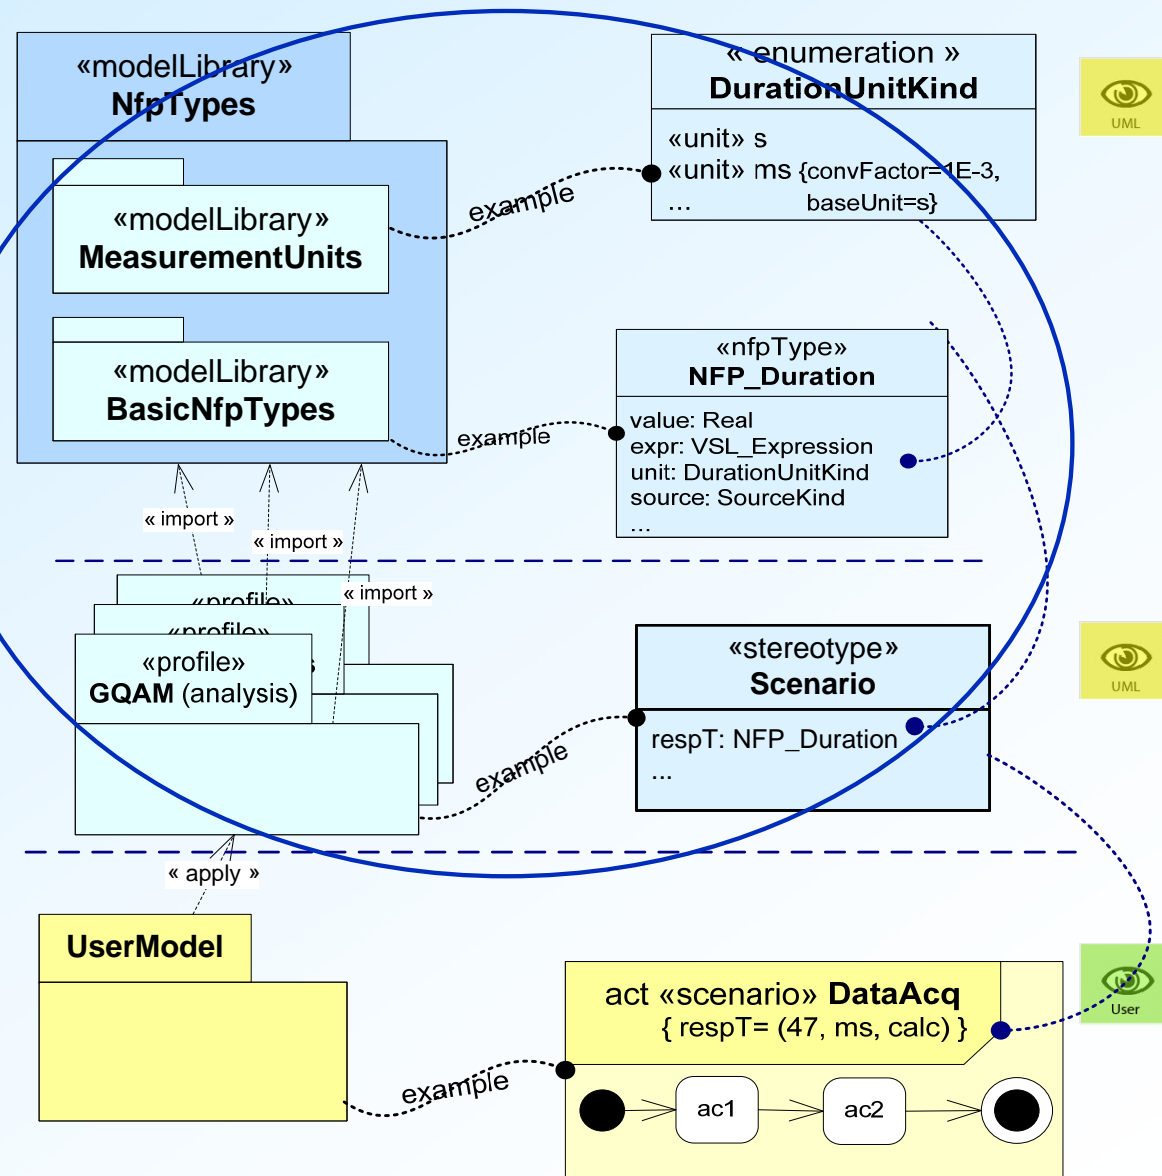

predefined

User-defined

# NFPs in Stereotype properties

## Pre-defined in MARTE

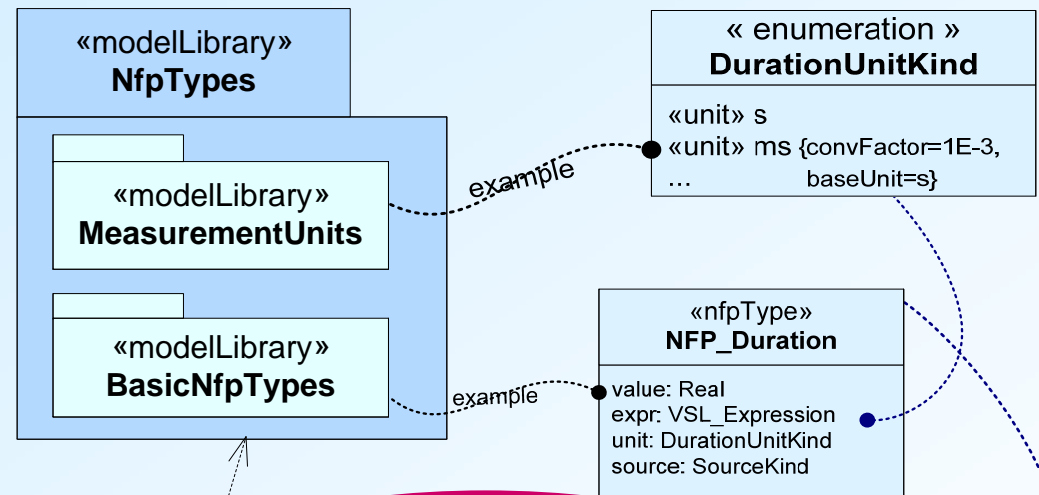

- 1) **Declare NFP types**
  - Define measurement units and conversion parameters
  - Define NFP types with qualifiers
- 2) **Define NFP extensions**
  - Define stereotypes and their properties using NFP types
- 3) **Specify NFP values**
  - Apply stereotypes and specify their properties using VSL

# User-defined NFPs in slots

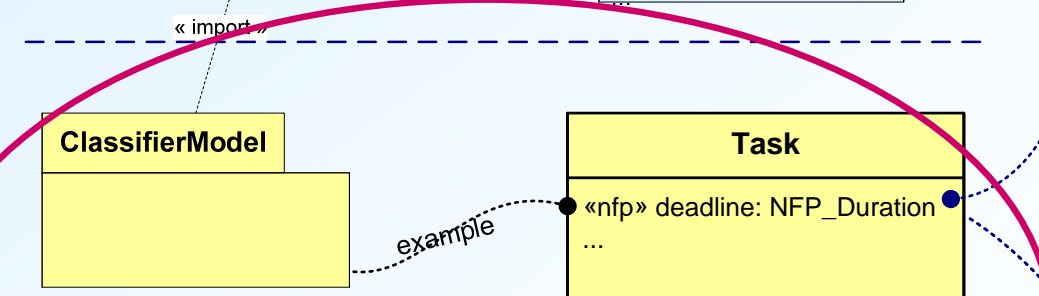

## 1) Declare NFP types

- Define measurement units and conversion parameters
- Define NFP types with qualifiers

## 2) Define NFP

- Define classifiers and their attributes using NFP types
- Apply the stereotype «nfp»

## 3) Specify NFP values

- Build instances and specify their slot values using VSL

## Model-specific NFPs

# Basic Textual Expressions

- Extended Primitive Values,
- Extended Composite Values,
- Extended Expressions

Value Spec.	Examples
<b>Real Number</b>	1.2E-3 //scientific notation
<b>DateTime</b>	#12/01/06 12:00:00# //calendar date time
<b>Collection</b>	{1, 2, 88, 5, 2} //sequence, bag, ordered set.. { {1,2,3}, {3,2} } //collection of collections
<b>Tuple and choice</b>	(value=2.0, unit= ms) //duration tuple value periodic(period=2.0, jitter=3.3) //arrival pattern
<b>Interval</b>	[1..251[ //upper opened interval between integers [\$A1..\$A2] //interval between variables
<b>Variable declaration &amp; Call</b>	io\$var1 //input/output variable declaration var1 //variable call expression.
<b>Arithmetic Operation Call</b>	+(5.0,var1) //"add" operation on Real datatypes 5.0+var1 //infix operator notation
<b>Conditional Expression</b>	((var1<6.0)?(10^6):1) //if true return 10 exp 6,else 1

# VSL Extended Data Types

## MARTE\_DataTypes

### « boundedSubtype »

{ baseType= Integer,  
minValue = -480000,  
maxValue = +480000}  
**Long**

« dataType »  
« intervalType »  
{ intervalAttrib = bound }  
**IntegerInterval**

bound: Integer [2]

### « collectionType »

{ collectionAttrib= vectorElement }  
**IntegerVector**

vectorElement: Integer [0..\*]

### « collectionType »

{ collectionAttrib= matrixElement }  
**IntegerMatrix**

matrixElement: IntegerVector [0..\*]

« tupleType »  
**Power**

value: Real  
expr: VSL\_Expression  
unit: PowerUnitKind  
source: SourceKind

« choiceType »  
**ArrivalPattern**

periodic: PeriodicPattern  
sporadic: SporadicPattern

« tupleType »  
**PeriodicPattern**

period: Real  
jitter: Real

« tupleType »  
**SporadicPattern**

minInterarrival: Real  
maxInterarrival: Real

Declaration  
example

- BoundedSubtype
- IntervalType
- CollectionType
- TupleType
- ChoiceType

## Examples::DataTypesUse

### MyClass

length: Long  
priorityRange: IntegerInterval  
position: IntegerVector  
shape: IntegerMatrix  
consumption: Power  
arrival: ArrivalPattern

### cl: MyClass

length = 212333  
priorityRange = [0..2]  
position= {2,3}  
shape = {{2,3},{1,5}}  
consumption = (-, exp=x\*v1, unit= mW, source= calc)  
arrival= periodic (period= 10, jitter= 0.1)

Specification example.

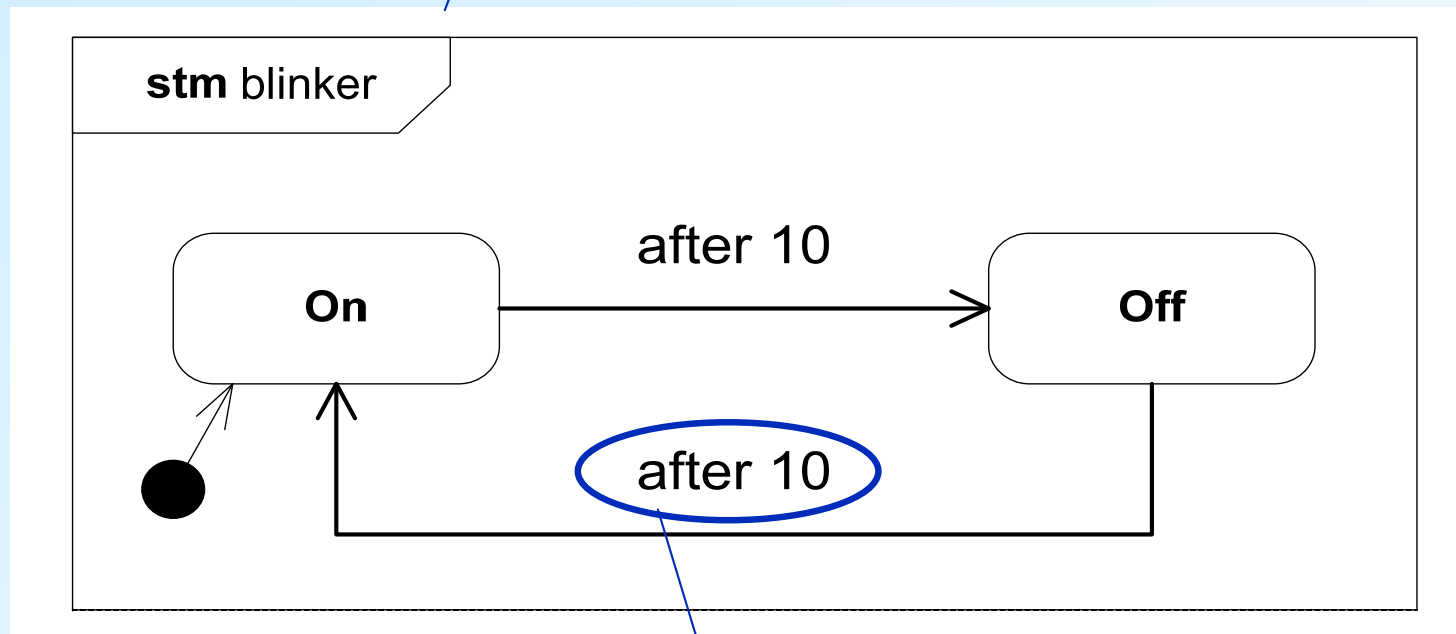

# MARTE Time Model

# UML::CommonBehaviors::SimpleTime

- UML2 adds **new metaclasses** to represent
  - Time
  - Duration
  - Observation (of time passing)
  - Some forms of **time constraints**
  
- **Simple** (even simplistic) model of time
  
- **Advice:** *Use a more sophisticated model of time provided by an **appropriate profile**, if needed.*  
[UML superstructure, chapter 13]

# TimeEvent – usage

UML state machine = behavior

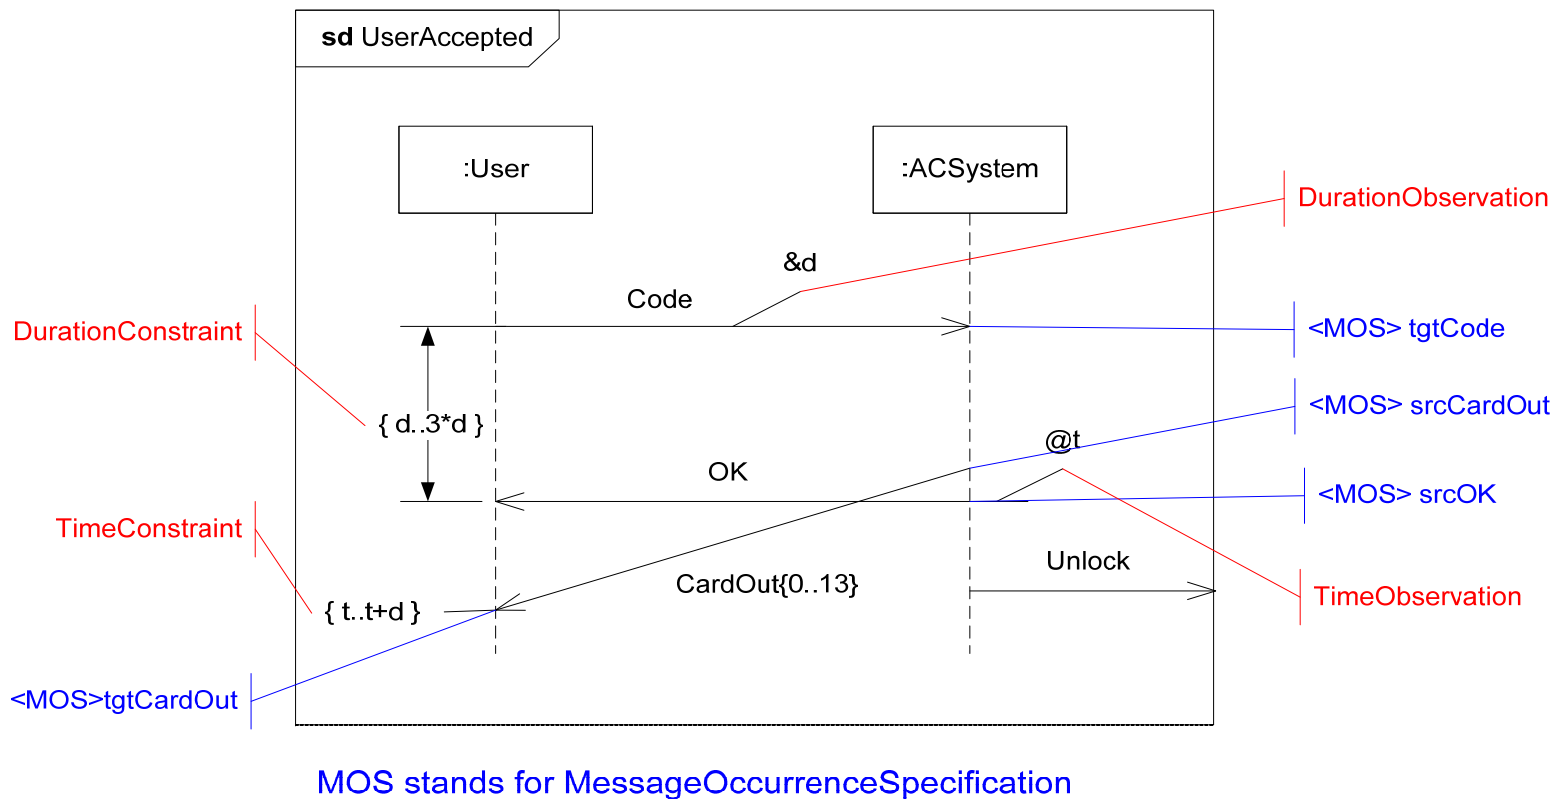

Specification of a time-trigger

Informal semantics

# Observation – usage

Example of sequence diagram

Note that **red** and **blue** annotations are not part of the UML notation.

# Concepts in MARTE::Time

- **Time structure:** set of time bases + time structure relations
  - Partially ordered set of instants
- **Access to time = Clock**
  - Physical/logical discrete/dense multiform time
- **Principle:** associate Clocks with model elements
  - Behavioral elements → TimedEvent, TimedProcessing
  - Constraints → TimedConstraint
  - Data types and values → TimedValue

# Logical multiform time (1/4)

- Modeling the “knock”
  - “time” properties expressed in rotation angles of the crankshaft
  - The actual “physical” time depends on the rotation speed and can be complex.

<http://fr.wikipedia.org/wiki/Fichier:4-Stroke-Engine.gif>

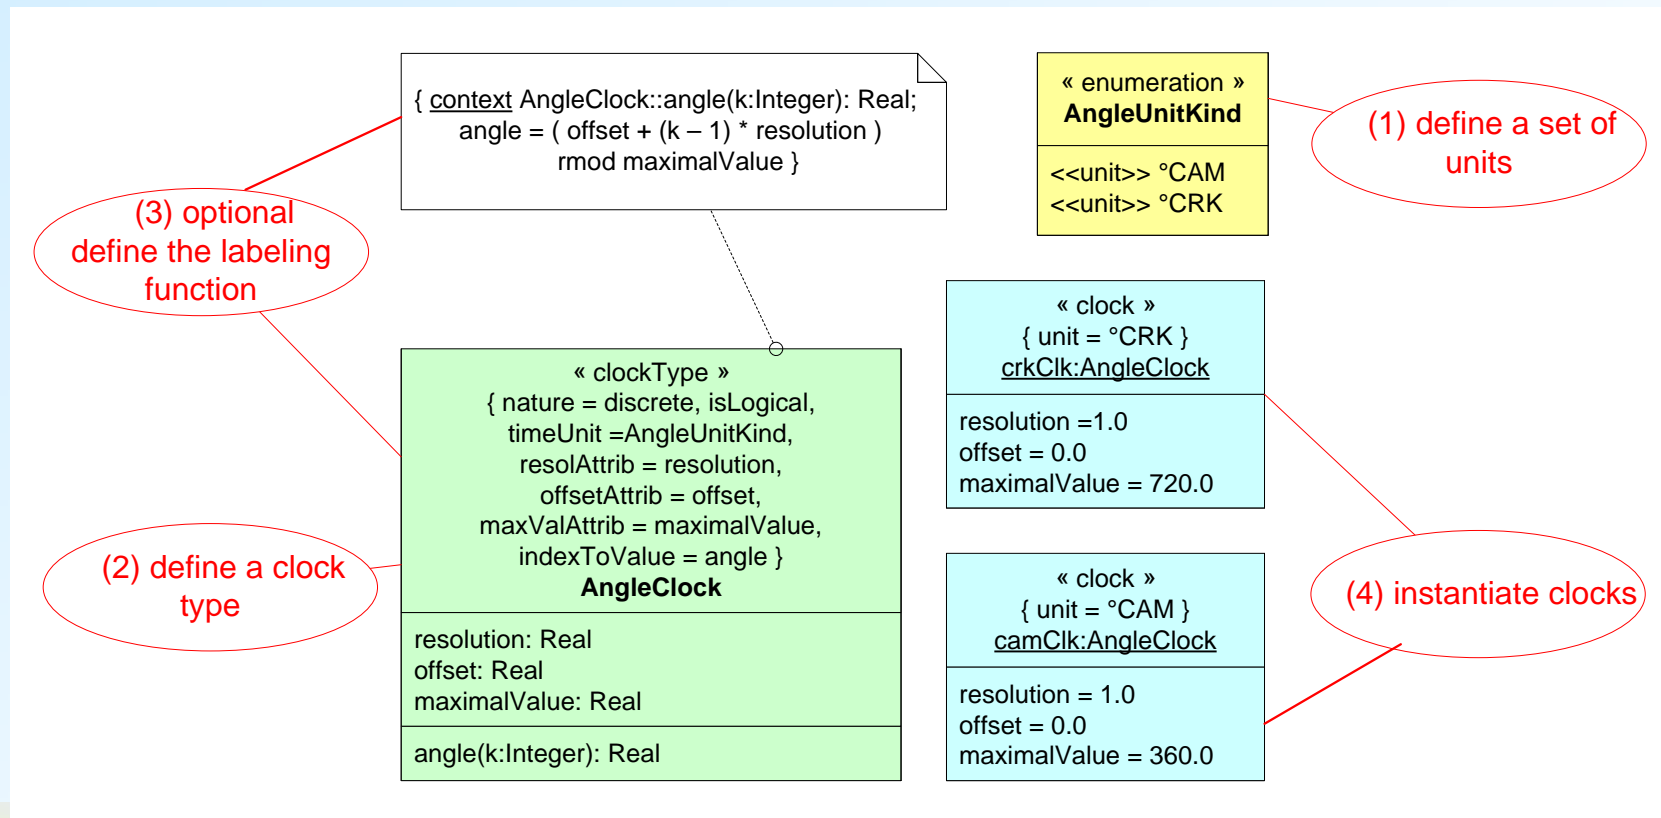

# Multiform time (2/4)

An example of logical clocks

## Automotive application

For ignition and injection, the position of the camshaft or the crankshaft is a “natural” reference frame for events and behaviors.

=> Define logical clocks dealing with angular positions.

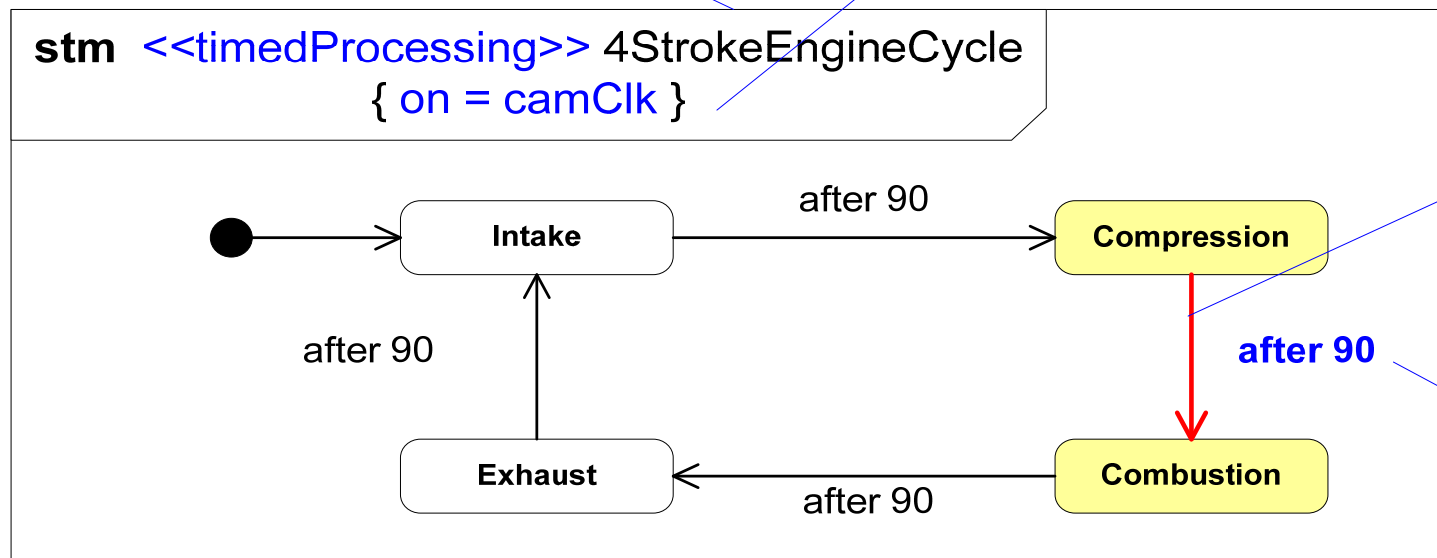

# Multiform time (3/4)

Example of usage of an “AngleClock”

Stereotyped State Machine.  
Makes reference to a Clock

Reference to a (logical) clock, the  
unit of which is °CAM (elsewhere  
defined)

A transition

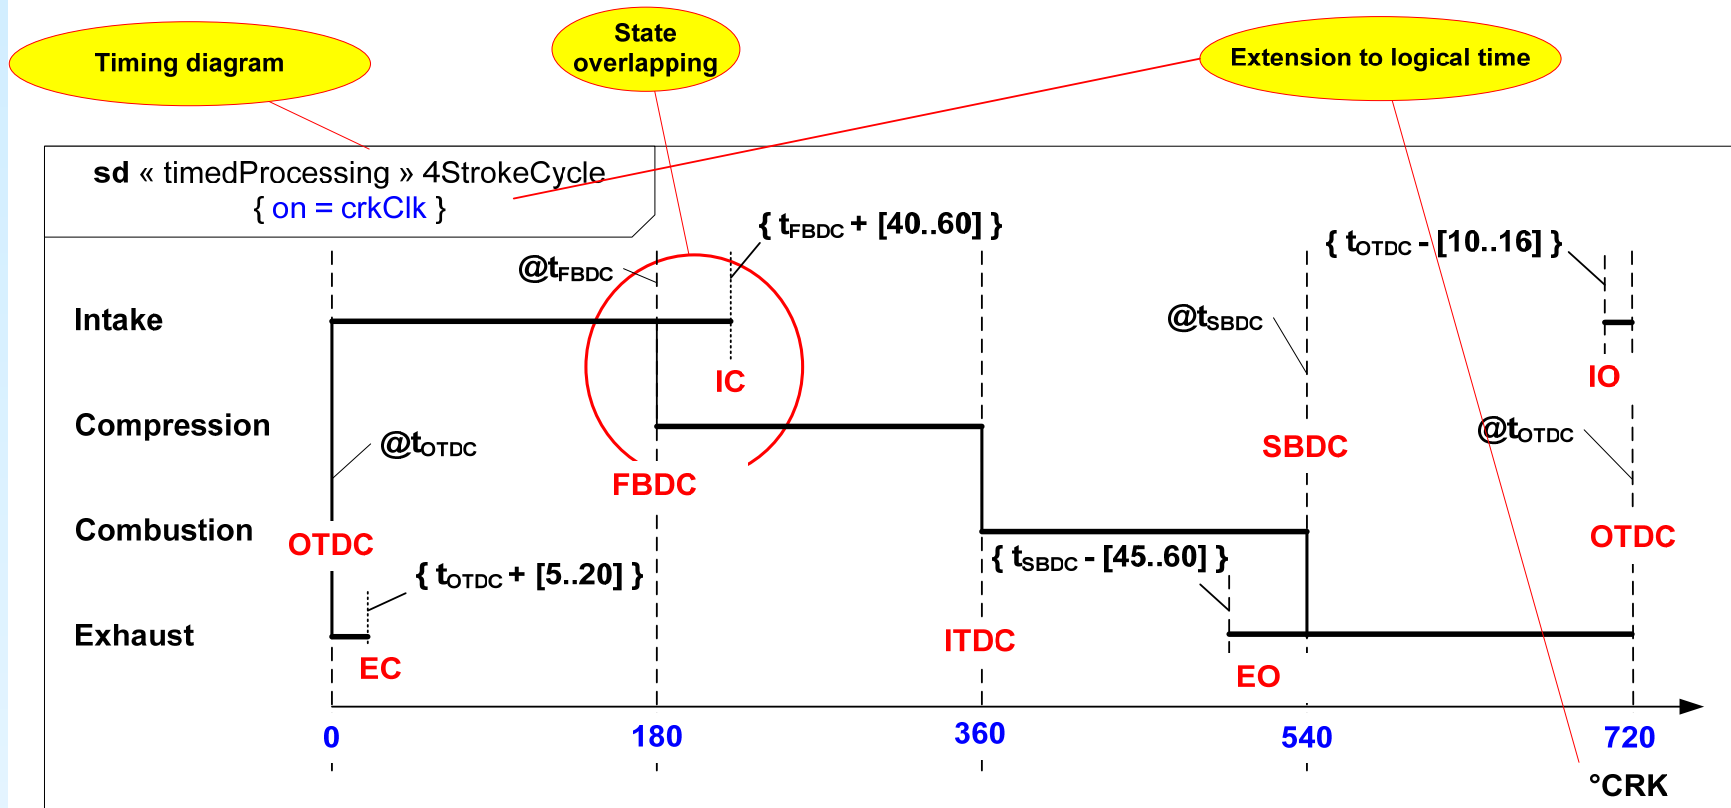

after 90

A trigger

**Semantics:**  
90 °CAM after  
entering state  
*Compression* leave  
this state and enter  
state *Combustion*

# Multiform time (4/4)

Another example of usage of an “AngleClock”:  
Enhanced timing diagram used in specification

crkClk: crankshaft Clock  
°CRK: degree crank

TDC: Top Dead Center  
ITDC: Ignition TDC  
OTDC: Overlap TDC

BDC: Bottom Dead Center  
FBDC: First BDC  
SBDC: Second BDC

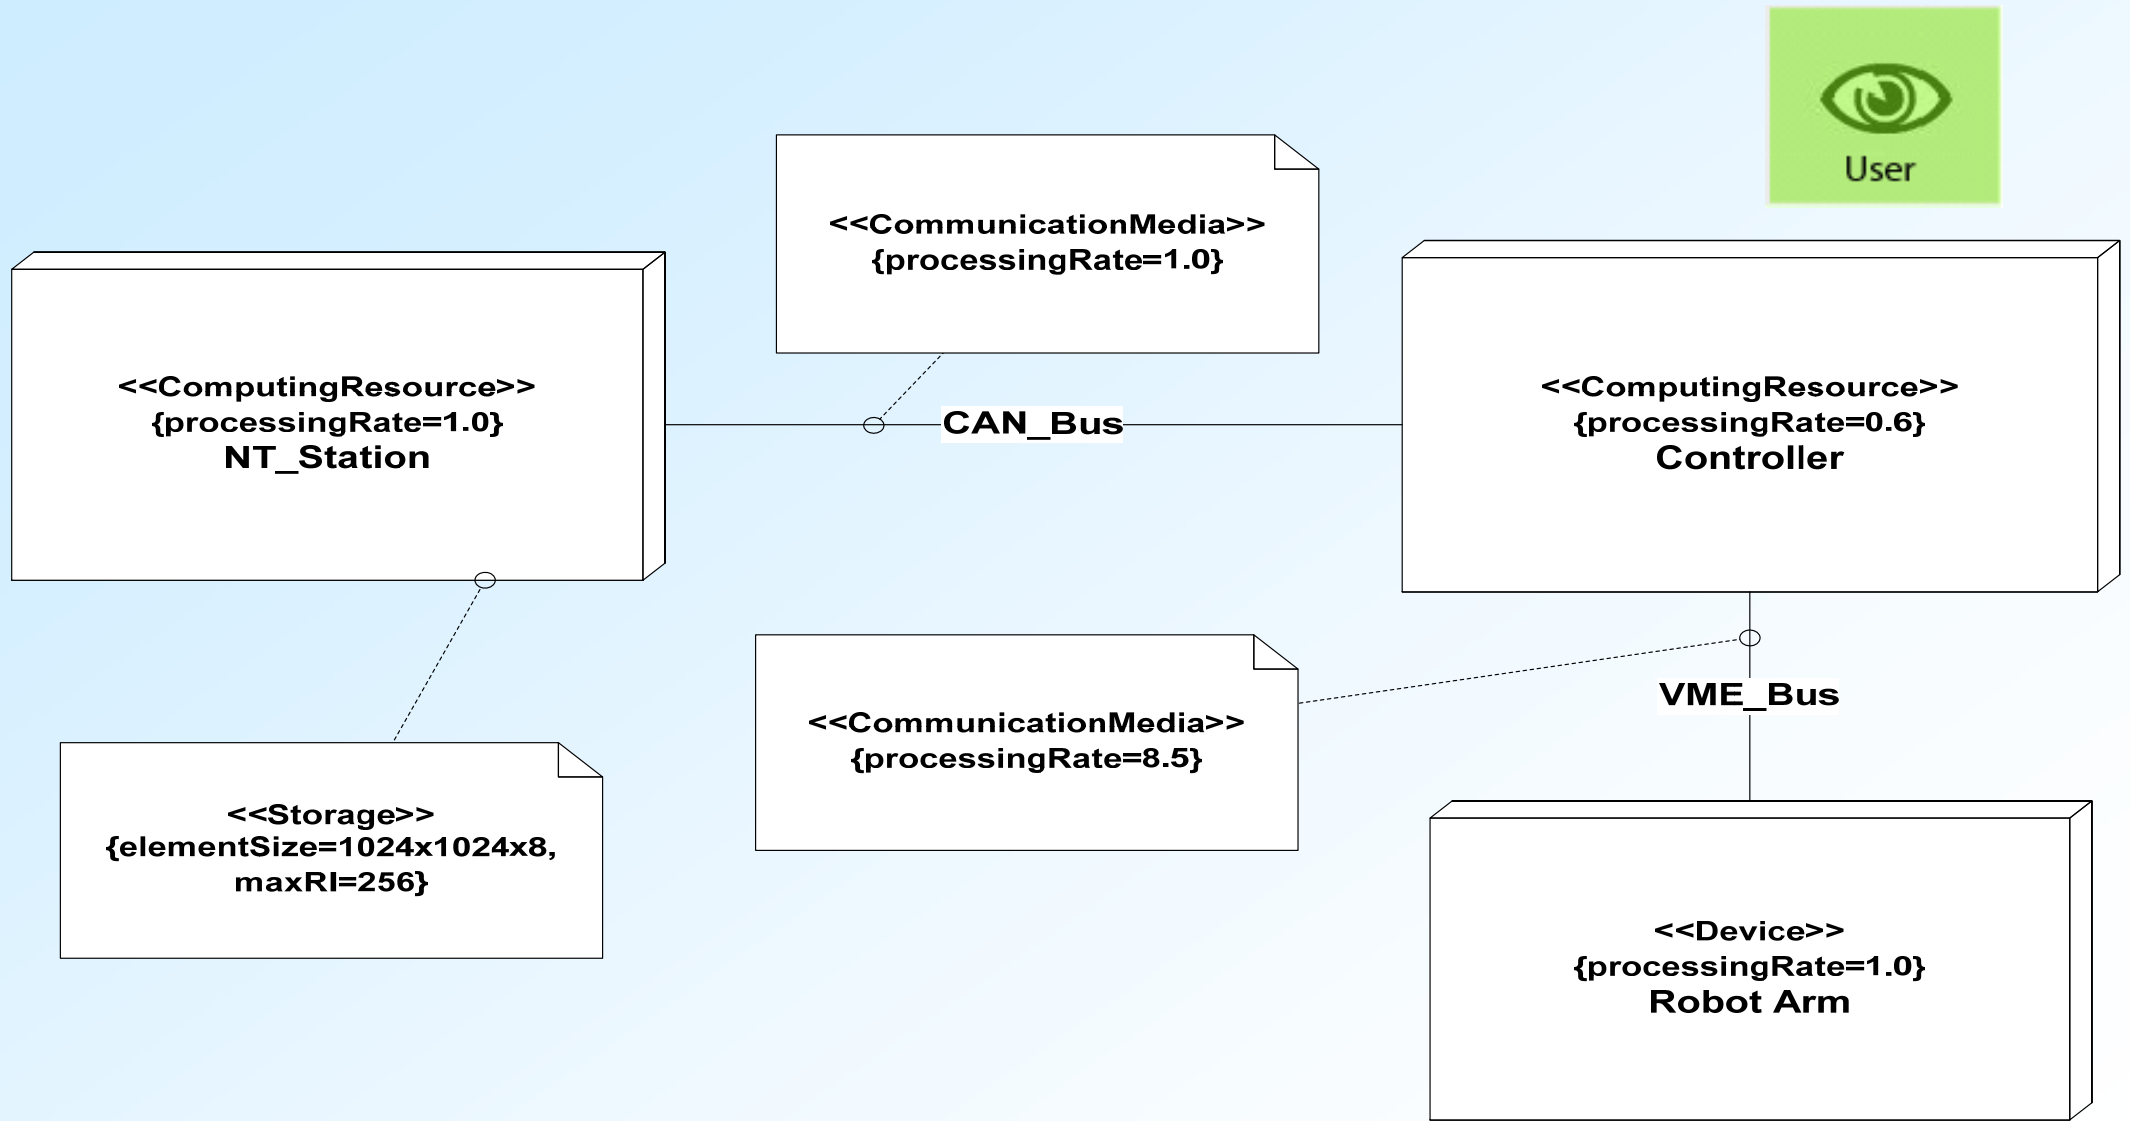

IC: Intake closes  
IO: Intake opens  
EC: Exhaust closes  
EO: Exhaust opens

# Resource Modeling

- Generic Resource Modeling (**GRM**)
- Detailed Resource Modeling (**DRM**)
  - Software Resource Modeling (**SRM**)
  - Hardware Resource Modeling (**HRM**)

# Generic resource modeling

# Allocation & Refinement

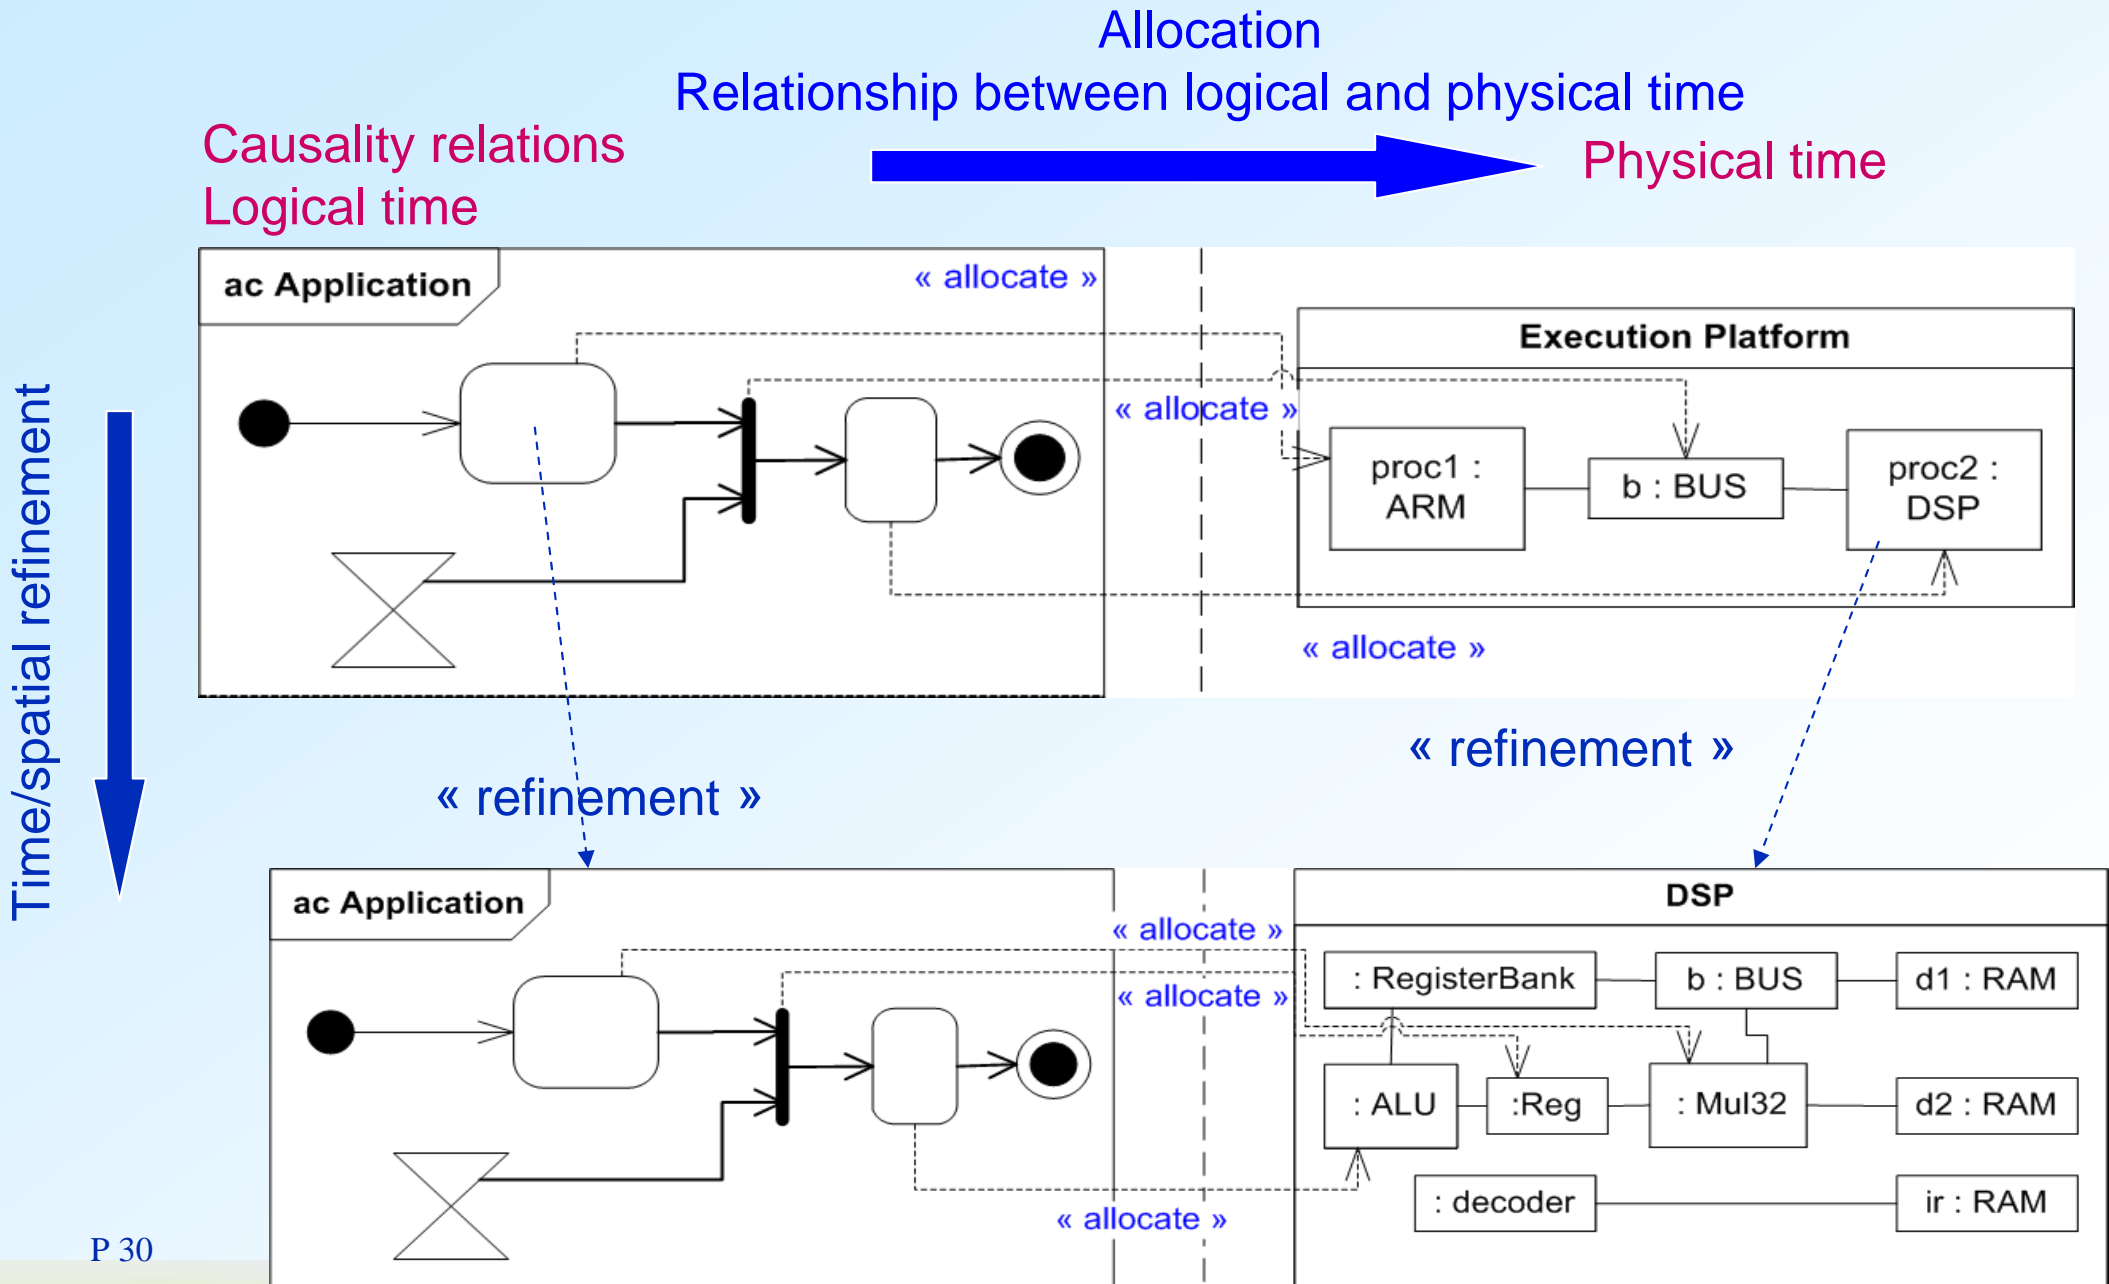

## □ Allocation in MARTE

- **Allocate** an application element to an execution platform element
  - **Application**: structure and behavior
  - **Execution platform**: structure and behavior # architecture
- **Refine** a general element into one or several more specific elements

## □ Inspired from the SysML allocation

- Can only allocate application to execution platform
- Can attach NFP constraints to the allocation (cost)

# Allocation in MARTE domain view

# MARTE Implementations

- **Currently available** ([www.omgmarTE.org](http://www.omgmarTE.org))
  - Full MARTE Profile & Libraries for Eclipse UML2
  - VSL editor for UML Papyrus tool and RSA 7.0
  - TimeSquare
  
- **Transformations under development**
  - To MAST, SymTA/S, Cheddar, RapidRMA

MARTE Open Source Implementation in

UML Papyrus: [www.papyrusuml.org](http://www.papyrusuml.org)

IBM RSA: [www.omgmarTE.org](http://www.omgmarTE.org)

# Status

- ❑ **MARTE v1.0** has been adopted in June 2009
- ❑ **Revision Task Force** starts in July 2009 => v1.1
  - Implementation by tool vendors [within 2 years]
  - Up to now, only academic tools
  - Submit your issues to [www.omg.org](http://www.omg.org)
- ❑ Expected results in July 2010
  - The RTF only addresses implementation issues

# Perspectives

- ❑ Define methodologies to use MARTE
  - On-going for DoD
  
- ❑ Alignment with SysML
  - Allocation, NFP, Quantity-Unit-Dimension, Time
  
- ❑ Refinement for domain-specific usages
  - IP-Xact (IP interchange)
  - AutoSAR (Automotive)
  - AADL (Avionics)
